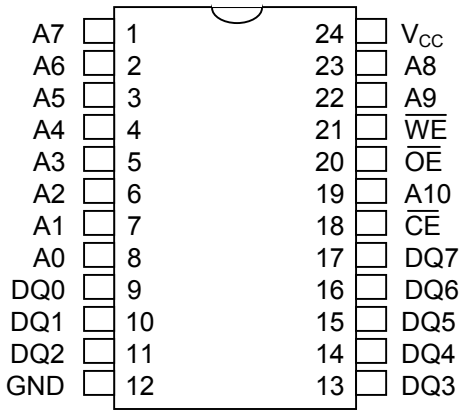
DS2016
2k x 8 3V/5V Operation Static RAM

www.maxim-ic.com

FEATURES

- Low-power CMOS design
- Standby current
  - 50nA max at t_A = +25°C V_{CC} = 3.0V
  - 100nA max at t_A = +25°C V_{CC} = 5.5V
  - 1µA max at t_A = +60°C V_{CC} = 5.5V
- Full operation for V_{CC} = 5.5V to 2.7V
- Data retention voltage = 5.5V to 2.0V
- Fast 5V access time
  - DS2016-100 100ns
- Reduced-speed 3V access time
  - DS2016-100 250ns
- Operating temperature range of -40°C to +85°C
- Full static operation
- TTL compatible inputs and outputs over voltage range of 5.5V to 2.7V
- Available in 24-pin DIP and 24-pin SO packages
- Suitable for both battery operated and battery backup applications

PIN ASSIGNMENT



DS2016 24-Pin DIP (600mil)
DS2016R 24-Pin SO (300mil)

PIN DESCRIPTION

A0 to A10	- Address Inputs
DQ0 to DQ7	- Data Input/Output
$\overline{CE}$	- Chip Enable Input
$\overline{WE}$	- Write Enable Input
$\overline{OE}$	- Output Enable Input
V_{CC}	- Power Supply Input 2.7V - 5.5V
GND	- Ground

DESCRIPTION

The DS2016 2k x 8 3V/5V Operation Static RAM is a 16,384-bit, low-power, fully static random access memory organized as 2048 words by 8 bits using CMOS technology. The device operates from a single power supply with a voltage input between 2.7V and 5.5V. The chip enable input ($\overline{CE}$) is used for device selection and can be used in order to achieve the minimum standby current mode, which facilitates both battery operated and battery backup applications. The device provides access times as fast as 100ns when operated from a 5V power supply input and also provides relatively good performance of 250ns access while operating from a 3V input. The device maintains TTL-level inputs and outputs over the input voltage range of 2.7V to 5.5V. The DS2016 is most suitable for low-power applications where battery operation or battery backup for nonvolatility is required. The DS2016 is a JEDEC-standard 2k x 8 SRAM and is pin-compatible with ROM and EPROM of similar density.

NOTES:

1) $\overline{WE}$ is high for read cycles.

2) $\overline{OE}$ = V_{IH} or V_{IL}. If $\overline{OE}$ = V_{IH} during write cycle, the output buffers remain in a high impedance state.

3) t_{WP} is specified as the logical AND of $\overline{CE}$ and $\overline{WE}$. t_{WP} is measured from the latter of $\overline{CE}$ or $\overline{WE}$ going low to the earlier of $\overline{CE}$ or $\overline{WE}$ going high.

4) t_{DH} and t_{DS} are measured from the earlier of $\overline{CE}$ or $\overline{WE}$ going high.

5) If the $\overline{CE}$ low transition occurs simultaneously with or later than the $\overline{WE}$ low transition, the output buffers remain in a high impedance state.

6) If the $\overline{CE}$ high transition occurs prior to or simultaneously with the $\overline{WE}$ high transition, the output buffers remain in a high impedance state.

7) If $\overline{WE}$ is low or the $\overline{WE}$ low transition occurs prior to or simultaneously with the $\overline{CE}$ low transition, the output buffers remain in a high impedance state.

8) If the V_{IH} level of CE is 2.0V during the period that V_{CC} voltage is going down from 4.5V to 2.7V, I_{CCS1} current flows.

9) The DS2016 maintains full operation from 5.5V to 2.7V. The electrical characteristics tables show two tested and guaranteed points of operation. For operation between 4.5V and 3.5V, use the composite worst case characteristics from both 5V and 3V operation for design purposes.
