

FEATURES

- **Manages Total Power Between a USB Peripheral and Battery Charger**
- **Minimal Voltage Drop (100mV at 500mA)**
- **Ultralow Battery Drain: 1 μ A**
- **Reverse Current Blocking Diode Not Required**
- Undervoltage Lockout
- Very Few External Components
- Compatible with Several LTC Linear Battery Chargers
- Overtemperature Protected
- Dual Battery Charge Priority Management
- Low Profile (1mm) SOT-23 Package

APPLICATIONS

- Cellular Phones
- PDAs
- Digital Cameras
- MP3 Players
- Battery Backup Systems

DESCRIPTION

The LTC[®]4410 enables simultaneous battery charging and operation of portable USB 1.0 and 2.0 compliant devices while they are connected to a USB port. As the USB peripheral load increases, the LTC4410 proportionally reduces the battery charge current to keep the total current less than 500mA or 100mA, depending on the state of the MODE pin.

The LTC4410 includes a USB present output that drives an external P-channel MOSFET to disconnect the battery from the USB peripheral when the USB power is valid. This allows device operation when connected to the USB port, even when the battery is deeply discharged.

Other features include reverse current blocking, thermal shutdown and low quiescent current (80 μ A in 500mA MODE) that is compliant with USB Suspend Mode.

The LTC4410 is available in the low profile (1mm) SOT-23 (ThinSOT[™]) package.

	MODE = High, $I_{VOUT} = 500\text{mA}$, $T_A < 0^{\circ}\text{C}$, (Note 2)	●	450	550	μA
	MODE = Low, $I_{VOUT} = 0\text{mA}$ (Note 2)		430	370	μA
	MODE = Low, $I_{VOUT} = 100\text{mA}$ (Note 2)		470	510	μA

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: Current flows out of CHP, voltage at CHP = 0V.

Note 3: The LTC4410E is guaranteed to meet performance specifications from 0°C to 70°C. Specifications over the -40°C to 85°C operating temperature range are assured by design, characterization and correlation with statistical process controls.

Note 4: This IC includes overtemperature protection that is intended to protect the device during momentary overload conditions. Junction temperature will exceed 125°C when overtemperature protection is active. Continuous operation above the specified maximum operating junction temperature may impair device reliability.

Note 5: Based on long-term current density limitations.

OPERATION

The LTC4410 manages the total current consumption between a battery charger and a USB portable device. In a system using the LTC4410, a battery charger can be set up to charge at the maximum available current from the USB port without any need to reserve current for the device load. As the USB device current increases, the LTC4410 decreases the battery charge current so as not to exceed the maximum allowable current from the USB port. This allows for simultaneous battery charging and device operation. The LTC4410 can only reduce the battery charge current to zero. It is the responsibility of the USB device load to not exceed the USB power limits.

The LTC4410 uses an internal power MOSFET to sense load current. This MOSFET is held off when $V_{OUT} > V_{IN}$ or $V_{IN} < 4.2V$ (typ). A replica of the I_{VOUT} current equal to $I_{VOUT}/1000$ is sourced out of the CHP pin with an accuracy of $\pm 6\%$. This current can be summed into the PROG node of a battery charger to reduce the charge current. The LTC4410 is primarily designed to interface with battery chargers that use a program pin to set the maximum charge current, with a charge current to program pin current ratio of 1000:1. The voltage on CHP can be externally monitored to signal overcurrent conditions.

When $V_{IN} > 4.2V$, the internal USB present comparator forces the USBP pin high. This signal can be used to detect

when the USB voltage is present and drive an external switch to connect or disconnect a battery from the USB peripheral.

The MODE pin controls the state of an internal $370\mu A$ current reference (I_{REF}). When active (MODE pin low), the total current sourced out of CHP is $I_{VOUT}/1000 + I_{REF}$. The primary function of the current reference is to offset the battery charger charge current for 100mA mode. When MODE is high, the current reference is disabled. The total current out of CHP with MODE high is $I_{VOUT}/1000$. The MODE controlled current offset makes it possible to configure the battery charger and the LTC4410 to support the USB specification 1.0 and 2.0 required 100mA and 500mA modes of operation.

The low quiescent current ($80\mu A$, when MODE is high) of the LTC4410 makes the system easily compliant with the USB specifications 1.0 and 2.0 SUSPEND MODE current consumption requirements.

When $V_{OUT} > V_{IN}$, the LTC4410 transitions to low power mode, draining $1\mu A$ (typical) from the Lithium-Ion battery. This condition occurs when the USB device is operating off of its internal battery and not connected to the USB port.

APPLICATIONS INFORMATION

Dual Battery Charging with Priority

The LTC4410 can be used to manage two battery chargers, giving one of the chargers (see Figure 2) priority. When BAT1 is being charged, the charge current is flowing through the LTC4410. The LTC4410 is sensing the current and sourcing a current equal to BAT1 charge current/1000 out of CHP. This effectively reduces the BAT2 charger

current. As BAT1 current demands reduce, the current sourced out of CHP is reduced, enabling BAT2 to have more current. In this example the power supply is a 750mA minimum wall adapter, R_{PROG} (R2 and R3) for the chargers are 2k Ω , resulting in a 750mA charge current. In this application, the total current out of the wall adapter will never exceed 750mA.

PACKAGE DESCRIPTION

S6 Package
6-Lead Plastic TSOT-23
 (Reference LTC DWG # 05-08-1636)

- NOTE:
1. DIMENSIONS ARE IN MILLIMETERS
 2. DRAWING NOT TO SCALE
 3. DIMENSIONS ARE INCLUSIVE OF PLATING
 4. DIMENSIONS ARE EXCLUSIVE OF MOLD FLASH AND METAL BURR
 5. MOLD FLASH SHALL NOT EXCEED 0.254mm
 6. JEDEC PACKAGE REFERENCE IS MO-193
