

High-voltage half bridge driver

Features

- High voltage rail up to 600V
- dV/dt immunity $\pm 50V/nsec$ in full temperature range
- Driver current capability:
 - 400mA source,
 - 650mA sink
- Switching times 50/30 nsec rise/fall with 1nF load
- CMOS/TTL Schmitt trigger inputs with hysteresis and pull down
- Shut down input
- Dead time setting
- Under voltage lock out
- Integrated bootstrap diode
- Clamping on V_{CC}
- SO-8/DIP-8 packages

Description

The L6384E is a high-voltage device, manufactured with the BCD"OFF-LINE" technology. It has an Half - Bridge Driver structure that enables to drive N-channel Power MOS or IGBT. The High Side (Floating) Section is enabled to work with voltage Rail up to 600V. The Logic Inputs are CMOS/TTL compatible for ease of interfacing with controlling devices. Matched delays between Low and High Side Section simplify high frequency operation. Dead time setting can be readily accomplished by means of an external resistor.

1 Electrical data

1.1 Absolute maximum ratings

Table 1. Absolute maximum ratings

| Symbol | Parameter | Value | Unit |
|---------------|--|------------------------|------|
| V_{out} | Output voltage | -3 to $V_{boot} - 18$ | V |
| V_{cc} | Supply voltage ⁽¹⁾ | - 0.3 to 14.6 | V |
| I_s | Supply current ⁽¹⁾ | 25 | mA |
| V_{boot} | Floating supply voltage | -1 to 618 | V |
| V_{hvg} | High side gate output voltage | -1 to V_{boot} | V |
| V_{lvg} | Low side gate output voltage | -0.3 to $V_{cc} + 0.3$ | V |
| V_i | Logic input voltage | -0.3 to $V_{cc} + 0.3$ | V |
| V_{sd} | Shut down/dead time voltage | -0.3 to $V_{cc} + 0.3$ | V |
| dV_{out}/dt | Allowed output slew rate | 50 | V/ns |
| P_{tot} | Total power dissipation ($T_j = 85\text{ °C}$) | 750 | mW |
| T_j | Junction temperature | 150 | °C |
| T_s | Storage temperature | -50 to 150 | °C |

1. The device has an internal Clamping Zener between GND and the Vcc pin, It must not be supplied by a Low Impedence Voltage Source.

Note: ESD immunity for pins 6, 7 and 8 is guaranteed up to 900 V (Human Body Model)

1.2 Thermal data

Table 2. Thermal data

| Symbol | Parameter | SO-8 | DIP-8 | Unit |
|--------------|--|------|-------|------|
| $R_{th(JA)}$ | Thermal Resistance Junction to ambient | 150 | 100 | °C/W |

1.3 Recommended operating conditions

Table 3. Recommended operating conditions

| Symbol | Pin | Parameter | Test condition | Min | Typ | Max | Unit |
|----------------|-----|-------------------------|--------------------------|-----|-----|-------------|------|
| V_{out} | 6 | Output Voltage | | (1) | | 580 | V |
| $V_{BS}^{(2)}$ | 8 | Floating Supply Voltage | | (1) | | 17 | V |
| f_{sw} | | Switching Frequency | HVG,LVG load $C_L = 1nF$ | | | 400 | kHz |
| V_{cc} | 2 | Supply Voltage | | | | V_{clamp} | V |
| T_j | | Junction Temperature | | -45 | | 125 | °C |

1. If the condition $V_{boot} - V_{out} < 18V$ is guaranteed, V_{out} can range from -3 to 580V.

2. $V_{BS} = V_{boot} - V_{out}$

2 Pin connection

Figure 2. Pin connection (Top view)

Table 4. Pin description

| N° | Pin | Type | Function |
|----|------------------|------|---|
| 1 | IN | I | Logic Input: it is in phase with HVG and in opposition of phase with LVG. It is compatible to V _{CC} voltage. [V _{il Max} = 1.5V, V _{ih Min} = 3.6V] |
| 2 | V _{CC} | | Supply input voltage: there is an internal clamp [Typ. 15.6V] |
| 3 | DT/SD | I | High impedance pin with two functionalities. When pulled lower than V _{dt} [Typ. 0.5V] the device is shut down. A voltage higher than V _{dt} sets the dead time between high side gate driver and low side gate driver. The dead time value can be set forcing a certain voltage level on the pin or connecting a resistor between pin 3 and ground. Care must be taken to avoid below threshold spikes on pin 3 that can cause undesired shut down of the IC. For this reason the connection of the components between pin 3 and ground has to be as short as possible. This pin can not be left floating for the same reason. The pin has not be pulled through a low impedance to V _{CC} , because of the drop on the current source that feeds R _{dt} . The operative range is: V _{dt} ...270K · I _{dt} , that allows a dt range of 0.4 - 3.1 μs. |
| 4 | GND | | Ground |
| 5 | LVG | O | Low Side Driver Output: the output stage can deliver 400mA source and 650mA sink [Typ. Values]. The circuit guarantees 0.3V max on the pin (@ I _{sink} = 10mA) with V _{CC} > 3V and lower than the turn on threshold. This allows to omit the bleeder resistor connected between the gate and the source of the external mosfet normally used to hold the pin low; the gate driver ensures low impedance also in SD conditions. |
| 6 | V _{out} | O | High Side Driver Floating Reference: layout care has to be taken to avoid below ground spikes on this pin. |
| 7 | HVG | O | High Side Driver Output: the output stage can deliver 400mA source and 650mA sink [Typ. Values]. The circuit guarantees 0.3V max between this pin and V _{out} (@ I _{sink} = 10mA) with V _{CC} > 3V and lower than the turn on threshold. This allows to omit the bleeder resistor connected between the gate and the source of the external mosfet normally used to hold the pin low; the gate driver ensures low impedance also in SD conditions. |
| 8 | Vboot | | Bootstrap Supply Voltage: it is the high side driver floating supply. The bootstrap capacitor connected between this pin and pin 6 can be fed by an internal structure named "bootstrap driver" (a patented structure). This structure can replace the external bootstrap diode. |

3 Electrical characteristics

3.1 AC operation

Table 5. AC operation electrical characteristics ($V_{CC} = 14.4V$; $T_J = 25^\circ C$)

| Symbol | Pin | Parameter | Test condition | Min | Typ | Max | Unit |
|------------|----------|---|--------------------------------------|-----|------------|-----|------|
| t_{on} | 1 vs 5,7 | High/low side driver turn-on propagation delay | $V_{out} = 0V$ $R_{dt} = 47k\Omega$ | | 200+ dt | | ns |
| t_{onsd} | 3 vs 5,7 | Shut down input propagation delay | | | 220 | 280 | ns |
| t_{off} | 1 vs 5,7 | High/low side driver turn-off propagation delay | $V_{out} = 0V$ $R_{dt} = 47k\Omega$ | | 250 | 300 | ns |
| | | | $V_{out} = 0V$ $R_{dt} = 146k\Omega$ | | 200 | 250 | ns |
| | | | $V_{out} = 0V$ $R_{dt} = 270k\Omega$ | | 170 | 200 | ns |

| R_{dson} | | Bootstrap driver on resistance ⁽¹⁾ | $V_{cc} \geq 12.5V$; IN = LOW | | 125 | | Ω |

Table 6. DC operation electrical characteristics (continued) ($V_{CC} = 14.4V$; $T_J = 25^\circ C$)

| Symbol | Pin | Parameter | Test condition | Min | Typ | Max | Unit |
|-----------------------------|----------|--|--|-----|-------------------|-----|-------------------------------|
| High/Low side driver | | | | | | | |
| I_{so} | 5,7 | Source short circuit current | $V_{IN} = V_{ih}$ ($t_p < 10\mu s$) | 300 | 400 | | mA |
| I_{si} | | Sink short circuit current | $V_{IN} = V_{il}$ ($t_p < 10\mu s$) | 500 | 650 | | mA |
| Logic inputs | | | | | | | |
| V_{il} | 1,3 | Low level logic threshold voltage | | | | 1.5 | V |
| V_{ih} | | High level logic threshold voltage | | 3.6 | | | V |
| I_{ih} | | High level logic input current | $V_{IN} = 15V$ | | 50 | 70 | μA |
| I_{il} | | Low level logic input current | $V_{IN} = 0V$ | | | 1 | μA |
| I_{ref} | 3 | Dead time setting current | | | 28 | | μA |
| dt | 3 vs 5,7 | Dead time setting range ⁽²⁾ | $R_{dt} = 47k\Omega$ $R_{dt} = 146k\Omega$ $R_{dt} = 270k\Omega$ | 0.4 | 0.5 1.5 2.7 | | μs μs μs |
| V_{dt} | 3 | Shutdown threshold | | | 0.5 | | V |

1. $R_{DS(on)}$ is tested in the following way:

$$R_{DS(on)} = \frac{(V_{CC} - V_{CBOOT1}) - (V_{CC} - V_{CBOOT2})}{I_1(V_{CC}, V_{CBOOT1}) - I_2(V_{CC}, V_{CBOOT2})}$$

where I_1 is pin 8 current when $V_{CBOOT} = V_{CBOOT1}$, I_2 when $V_{CBOOT} = V_{CBOOT2}$

2. Pin 3 is a high impedance pin. Therefore dt can be set also forcing a certain voltage V_3 on this pin. The dead time is the same obtained with a R_{dt} if it is: $R_{dt} \times I_{ref} = V_3$.

3.3 Timing diagram

Figure 3. Input/output timing diagram

4 Bootstrap driver

A bootstrap circuitry is needed to supply the high voltage section. This function is normally accomplished by a high voltage fast recovery diode (*Figure 4 a*). In the L6384E a patented integrated structure replaces the external diode. It is realized by a high voltage DMOS, driven synchronously with the low side driver (LVG), with in series a diode, as shown in *Figure 4 b*. An internal charge pump (*Figure 4 b*) provides the DMOS driving voltage. The diode connected in series to the DMOS has been added to avoid undesirable turn on of it.

4.1 C_{BOOT} selection and charging

To choose the proper C_{BOOT} value the external MOS can be seen as an equivalent capacitor. This capacitor C_{EXT} is related to the MOS total gate charge:

$$C_{EXT} = \frac{Q_{gate}}{V_{gate}}$$

The ratio between the capacitors C_{EXT} and C_{BOOT} is proportional to the cyclical voltage loss. It has to be:

$$C_{BOOT} \gg C_{EXT}$$

e.g.: if Q_{gate} is 30nC and V_{gate} is 10V, C_{EXT} is 3nF. With C_{BOOT} = 100nF the drop would be 300mV.

If HVG has to be supplied for a long time, the C_{BOOT} selection has to take into account also the leakage losses.

e.g.: HVG steady state consumption is lower than 200μA, so if HVG T_{ON} is 5ms, C_{BOOT} has to supply 1μC to C_{EXT}. This charge on a 1μF capacitor means a voltage drop of 1V.

The internal bootstrap driver gives great advantages: the external fast recovery diode can be avoided (it usually has great leakage current).

This structure can work only if V_{OUT} is close to GND (or lower) and in the meanwhile the LVG is on. The charging time (T_{charge}) of the C_{BOOT} is the time in which both conditions are fulfilled and it has to be long enough to charge the capacitor.

The bootstrap driver introduces a voltage drop due to the DMOS R_{DSON} (typical value: 125 Ω). At low frequency this drop can be neglected. Anyway increasing the frequency it must be taken in to account.

The following equation is useful to compute the drop on the bootstrap DMOS:

$$V_{drop} = I_{charge} R_{dson} \rightarrow V_{drop} = \frac{Q_{gate}}{T_{charge}} R_{dson}$$

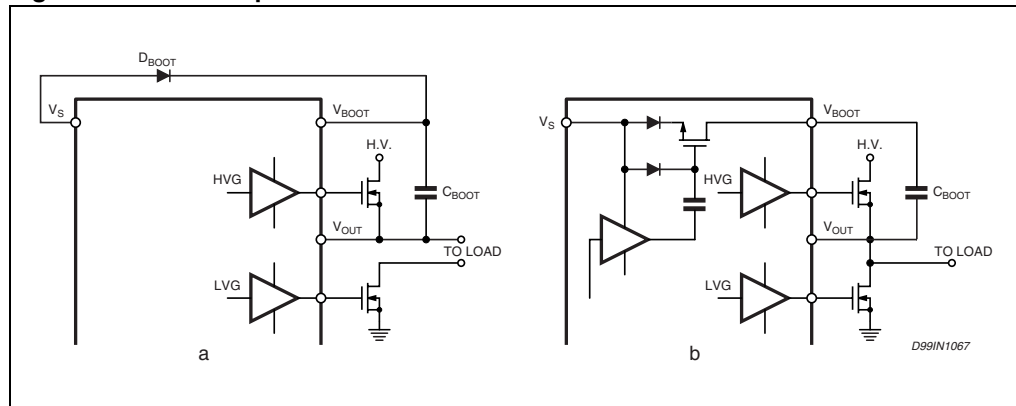

where Q_{gate} is the gate charge of the external power MOS, R_{dson} is the on resistance of the bootstrap DMOS, and T_{charge} is the charging time of the bootstrap capacitor.

For example: using a power MOS with a total gate charge of 30nC the drop on the bootstrap DMOS is about 1V, if the T_{charge} is 5 μs . In fact:

$$V_{\text{drop}} = \frac{30\text{nC}}{5\mu\text{s}} \cdot 125\Omega \sim 0.8\text{V}$$

V_{drop} has to be taken into account when the voltage drop on C_{BOOT} is calculated: if this drop is too high, or the circuit topology doesn't allow a sufficient charging time, an external diode can be used.

6 Package mechanical data

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second level interconnect . The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com
