## SELF-OSCILLATING HALF-BRIDGE DRIVER

#### **Features**

- Floating channel designed for bootstrap operation Fully operational to +600V Tolerant to negative transient voltage dV/dt immune
- Undervoltage lockout
- Programmable oscillator frequency

$$f = \frac{1}{1.4 \times (\mathsf{R}_{\mathsf{T}} + 75\Omega) \times \mathsf{C}_{\mathsf{T}}}$$

- Matched propagation delay for both channels
- Low side output in phase with R<sub>T</sub>

#### Description

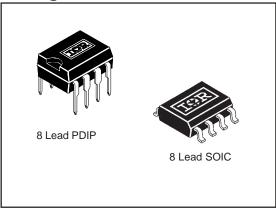

The IR2151 is a high voltage, high speed, self-oscillating power MOSFET and IGBT driver with both high and low side referenced output channels. Proprietary HVIC and latch immune CMOS technologies enable ruggedized monolithic construction. The front end features a programmable oscillator which is similar to the 555 timer. The output drivers feature a high pulse current buffer stage and an internal deadtime designed for minimum driver cross-conduction. Propagation delays for the two channels are matched to simplify use in 50% duty cycle applications. The floating channel can be used to drive an N-channel power MOSFET or IGBT in the high side configuration that operates off a high voltage rail up to 600 volts.

#### Product Summary

VOFFSET	600V max.
Duty Cycle	50%
IO+/-	100 mA / 210 mA
Vout	10 - 20V
Deadtime (typ.)	1.2 µs

#### **Packages**

#### **Absolute Maximum Ratings**

Absolute maximum ratings indicate sustained limits beyond which damage to the device may occur. All voltage parameters are absolute voltages referenced to COM. The thermal resistance and power dissipation ratings are measured under board mounted and still air conditions.

#### **Recommended Operating Conditions**

The input/output logic timing diagram is shown in figure 1. For proper operation the device should be used within the recommended conditions. The  $V_S$  offset rating is tested with all supplies biased at 15V differential.

Symbol	Definition	Min.	Max.	Units
VB	High side sloating supply absolute voltage	V <sub>S</sub> + 10	V <sub>S</sub> + 20	
Vs	High side floating supply offset voltage	_	600	.,
V <sub>HO</sub>	High side floating output voltage	VS	VB	V

ICC	Supply current (note 1)	—	5	mA
TA	Ambient temperature	-40	125	°C

Note 1: Because of the IR2151's application specificity toward off-line supply systems, this IC contains a zener clamp structure between the chip V<sub>CC</sub> and COM which has a nominal breakdown voltage of 15.6V. Therefore, the IC supply voltage is normally derived by forcing current into the supply lead (typically by means of a high value resistor connected between the chip V<sub>CC</sub> and the rectified line voltage and a local decoupling capacitor from V<sub>CC</sub> to COM) and allowing the internal zener clamp circuit to determine the nominal supply voltage. Therefore, this circuit should not be driven by a DC, low impedance power source of greater than V<sub>CLAMP</sub>.

#### **Dynamic Electrical Characteristics**

 $V_{BIAS}$  (V<sub>CC</sub>, V<sub>BS</sub>) = 12V, C<sub>L</sub> = 1000 pF and T<sub>A</sub> = 25°C unless otherwise specified.
