

## 10 mΩ high-side driver with analog current sense for automotive applications

### Features

Max supply voltage	V <sub>CC</sub>	41 V
Operating voltage range	V <sub>CC</sub>	4.5 V to 28 V
Typ. ON-state resistance	R <sub>ON</sub>	10 mΩ
Current limitation (typ)	I <sub>LIMH</sub>	85 A
OFF-state supply current	I <sub>S</sub>	2 µA <sup>(1)</sup>

1. Typical value with all loads connected

- General
  - Inrush current active management by power limitation
  - Very low standby current
  - 3 V CMOS compatible inputs
  - Optimized electromagnetic emissions
  - Very low electromagnetic susceptibility
  - In compliance with the 2002/95/EC european directive
  - Very low current sense leakage
- Diagnostic functions
  - Proportional load current sense
  - High current sense precision for wide current range
  - Current sense disable
  - OFF-state open-load detection
  - Output short to V<sub>CC</sub> detection
  - Overload and short to ground (power limitation) indication
  - Thermal shutdown indication
- Protection
  - Undervoltage shutdown
  - Overvoltage clamp
  - Load current limitation
  - Self limiting of fast thermal transients
  - Protection against loss of ground and loss of V<sub>CC</sub>
  - Overtemperature shut down with autorestart (thermal shutdown)

- Reverse battery protection with self switch on of the Power MOSFET (see [Figure 32](#))
- Electrostatic discharge protection

### Applications

- All types of resistive, inductive and capacitive loads
- Suitable as LED driver

### Description

The VN5E010AH is a single-channel high-side driver manufactured in the ST proprietary VIPower M0-5 technology and housed in the tiny HPAK package. The VN5E010AH is designed to drive 12 V automotive grounded loads delivering protection, diagnostics and easy 3 V and 5 V CMOS compatible interface with any microcontroller.

The device integrates advanced protective functions such as load current limitation, inrush and overload active management by power limitation, overtemperature shut-off with auto-restart and overvoltage active clamp. A dedicated analog current sense pin is associated with every output channel in order to provide enhanced diagnostic functions including fast detection of overload and short-circuit to ground through power limitation indication, overtemperature indication, short-circuit to V<sub>CC</sub> diagnosis and ON- and OFF-state open-load detection.

The current sensing and diagnostic feedback of the whole device can be disabled by pulling the CS\_DIS pin high to allow sharing of the external sense resistor with other similar devices.

### 2.1 Absolute maximum ratings

Stressing the device above the rating listed in the [Table 3: Absolute maximum ratings](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE program and other relevant quality document.

- To ensure long term reliability under heavy overload or short-circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles

### 3 Application information

**Figure 32. Application schematic**

#### 3.1 Load dump protection

$D_{Id}$  is necessary (voltage transient suppressor) if the load dump peak voltage exceeds the  $V_{CC}$  max DC rating. The same applies if the device is subject to transients on the  $V_{CC}$  line that are greater than the ones shown in the ISO 7637-2 2004 (E) table.

#### 3.2 MCU I/Os protection

When negative transients are present on the  $V_{CC}$  line, the control pins are pulled negative to approximately -1.5 V. ST suggests to insert a resistor ( $R_{prot}$ ) in line to prevent the microcontroller I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the HSD I/Os (input levels compatibility) with the latch-up limit of microcontroller I/Os.

##### Equation 1

$$-V_{CCpeak} / I_{latchup} \leq R_{prot} \leq (V_{OH\mu C} - V_{IH}) / I_{IHmax}$$

Calculation example:

For  $V_{CCpeak} = -1.5$  V;  $I_{latchup} \geq 20$  mA;  $V_{OH\mu C} \geq 4.5$  V

$$75 \Omega \leq R_{prot} \leq 240 \text{ k}\Omega$$

Recommended values:  $R_{prot} = 10$  k $\Omega$ ,  $C_{EXT} = 10$  nF.

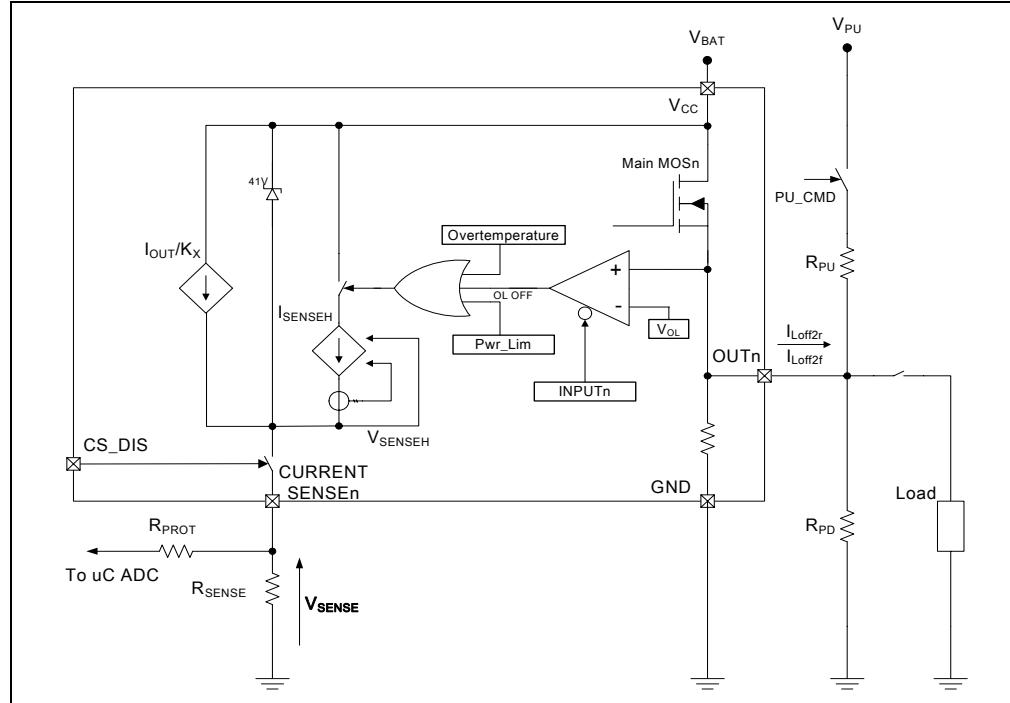

### 3.3 Current sense and diagnostic

The current sense pin performs a double function (see [Figure 33: Current sense and diagnostic](#)):

- **Current mirror of the load current in normal operation**, delivering a current proportional to the load one according to a know ratio  $K_X$ .  
The current  $I_{SENSE}$  can be easily converted to a voltage  $V_{SENSE}$  by means of an external resistor  $R_{SENSE}$ . Linearity between  $I_{OUT}$  and  $V_{SENSE}$  is ensured up to 5 V minimum (see parameter  $V_{SENSE}$  in [Table 9: Current sense \(8 V <  \$V\_{CC}\$  < 18 V\)](#)). The current sense accuracy depends on the output current (refer to current sense electrical characteristics [Table 9: Current sense \(8 V <  \$V\_{CC}\$  < 18 V\)](#)).
- **Diagnostic flag in fault conditions**, delivering a fixed voltage  $V_{SENSEH}$  up to a maximum current  $I_{SENSEH}$  in case of the following fault conditions (refer to [Table 11: Truth table](#)):
  - Power limitation activation
  - Overtemperature
  - Short to  $V_{CC}$  in OFF-state
  - Open load in OFF-state with additional external components.

A logic level high on CS\_DIS pin sets at the same time all the current sense pins of the device in a high-impedance state, thus disabling the current monitoring and diagnostic detection. This feature allows multiplexing of the microcontroller analog inputs by sharing of sense resistance and ADC line among different devices.

**Figure 33. Current sense and diagnostic**

### 3.3.1 Short to V<sub>CC</sub> and OFF-state open-load detection

#### Short to V<sub>CC</sub>

A short-circuit between V<sub>CC</sub> and output is indicated by the relevant current sense pin set to V<sub>SENSEH</sub> during the device OFF-state. Small or no current is delivered by the current sense during the ON-state depending on the nature of the short-circuit.

#### OFF-state open-load with external circuitry

Detection of an open load in off mode requires an external pull-up resistor R<sub>PU</sub> connecting the output to a positive supply voltage V<sub>PU</sub>.

It is preferable V<sub>PU</sub> to be switched off during the module standby mode in order to avoid the overall standby current consumption to increase in normal conditions, i.e. when load is connected.

An external pull-down resistor R<sub>PD</sub> connected between output and GND is mandatory to avoid misdetection in case of floating outputs in OFF-state (see *Figure 33: Current sense and diagnostic*).

R<sub>PD</sub> must be selected in order to ensure V<sub>OUT</sub> < V<sub>OLmin</sub> unless pulled-up by the external circuitry:

#### Equation 2

$$V_{OUT}|_{\text{Pull-up\_OFF}} = R_{PD} \cdot I_{L(\text{off2})f} < V_{OLmin} = 2 \text{ V}$$

R<sub>PD</sub> ≤ 22 kΩ is recommended.

For proper open load detection in OFF-state, the external pull-up resistor must be selected according to the following formula:

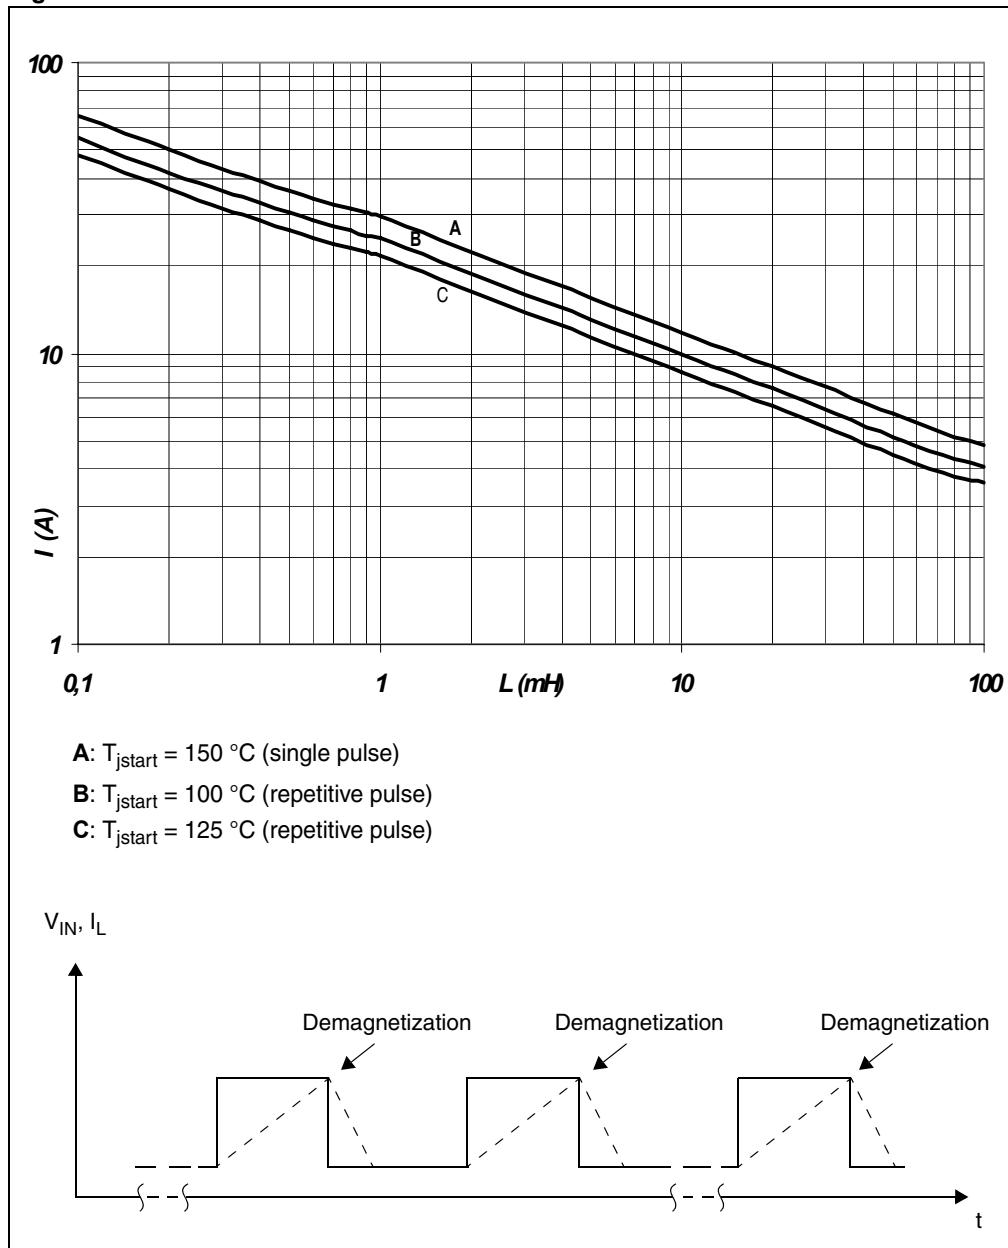

#### Equation 3

$$V_{OUT}|_{\text{Pull-up\_ON}} = \frac{(R_{PD} \cdot V_{PU}) - (R_{PU} \cdot R_{PD} \cdot I_{L(\text{off2})r})}{(R_{PU} + R_{PD})} > V_{OLmax} = 4 \text{ V}$$

For the values of V<sub>OLmin</sub>, V<sub>OLmax</sub>, I<sub>L(off2)r</sub> and I<sub>L(off2)f</sub> (see *Table 10: Open load detection (8 V < V<sub>CC</sub> < 18 V)*).

### 3.4 Maximum demagnetization energy ( $V_{CC} = 13.5$ V)

Figure 34. Maximum turn-off current versus inductance<sup>(1)</sup>

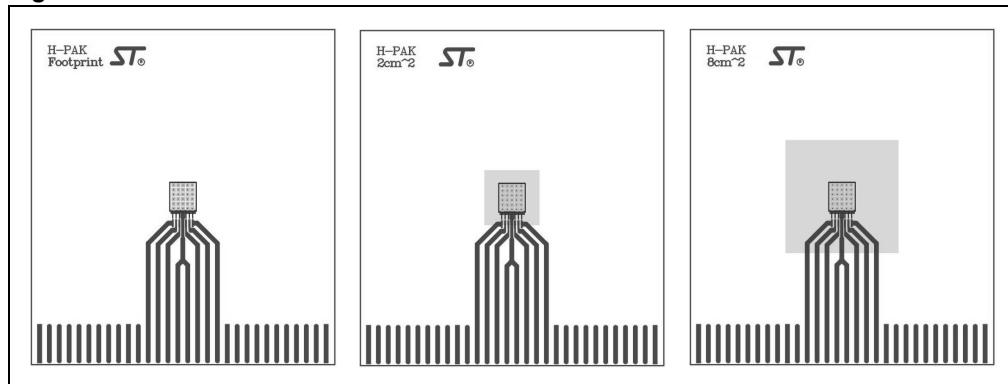

- Values are generated with  $R_L = 0 \Omega$ .

In case of repetitive pulses,  $T_{jstart}$  (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves A and B.
