Quad smart power solid state relay
for complete H bridge configurations

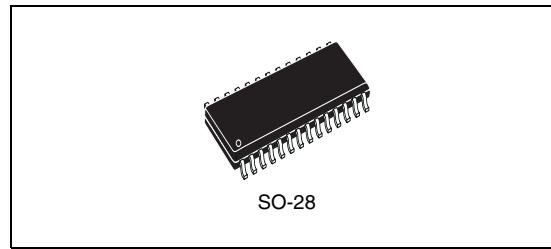

Features

Type	R _{DSON}	I _{OUT}	V _{CC}
VN5770AK-E	280mΩ ⁽¹⁾	8.5A ⁽²⁾	36V

1. Total resistance of one side in bridge configuration
 2. Typical current limitation value
- General features
 - Inrush current management by active power limitation on the high side switches
 - Very low stand-by current
 - Very low electromagnetic susceptibility
 - In compliance with the 2002/95/EC European directive
 - Protection
 - High side drivers undervoltage shutdown
 - Overvoltage clamp
 - Output current limitation
 - High and low side overtemperature shutdown
 - Short circuit protection
 - ESD protection
 - Diagnostic functions
 - Proportional load current sense
 - Thermal shutdown indication on both the high and low side switches

Description

The VN5770AK-E is a device formed by three monolithic chips housed in a standard SO-28 package: a double high side and two low side switches. The double high side is made using STMicroelectronics VIPower™ M0-5 Technology, while the low side switches are fully protected

VIPower™ M0-3 OMNIFET II. This device is suitable to drive a DC motor in a bridge configuration as well as to be used as a quad switch for any low voltage application.

The dual high side switches integrate built-in non-latching thermal shutdown with thermal hysteresis. An output current limiter protects the device in overload condition. In the case of long overload duration, the device limits the dissipated power to a safe level up to thermal shut-down intervention. An analog current sense pin delivers a current proportional to the load current (according to a known ratio) and indicates overtemperature shutdown of the relevant high side switch through a voltage flag.

The low side switches have built-in non-latching thermal shutdown with thermal hysteresis, linear current limitation and overvoltage clamping.

Fault feedback for overtemperature shutdown of the low side switch is indicated by the relevant input pin current consumption going up to the fault sink current flag.

Applications

- DC motor driving in full or half bridge configuration
- All types of resistive, inductive and capacitive loads

2 Absolute maximum ratings

Stressing the device above the rating listed in the “Absolute maximum ratings” table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not implied. Exposure to the conditions in *Section 2.1: Absolute maximum ratings* for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality document.

1. To ensure long term reliability under heavy overload or short circuit conditions, protection and related diagnostic signals must be used together with a proper software strategy. If the device is subjected to abnormal conditions, this software must limit the duration and number of activation cycles

4 Application information

Figure 33. Typical application schematic

Note:

Mostly motor bridge drivers use a reverse battery protection diode (D) inside supply rail. This diode prevents a reverse current flow back to V_{batt} in case the bridge gets disabled via the logic inputs while motor inductance still carries energy. In order to prevent a hazardous overvoltage at circuit supply terminal (V_{cc}), a blocking capacitor (C) is needed to limit the voltage overshoot. As basic orientation, $50\mu F$ per 1A load current is recommended. In alternative, also a Zener protection (Z) is suitable. Even if a reverse polarity diode is not present, it is recommended to use a capacitor or zener at V_{cc} because a similar problem appears in case supply terminal of the module has intermittent electrical contact to the battery or gets disconnected while motor is operating.

Note: Values are generated with $R_L=0\Omega$

In the case of repetitive pulses, T_{jstart} (at beginning of each demagnetization) of every pulse must not exceed the temperature specified above for curves B and C.

6 Package and packing information

6.1 ECOPACK® packages

In order to meet environmental requirements, ST offers these devices in ECOPACK® packages. These packages have a Lead-free second-level interconnect. The category of Second-Level Interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label.

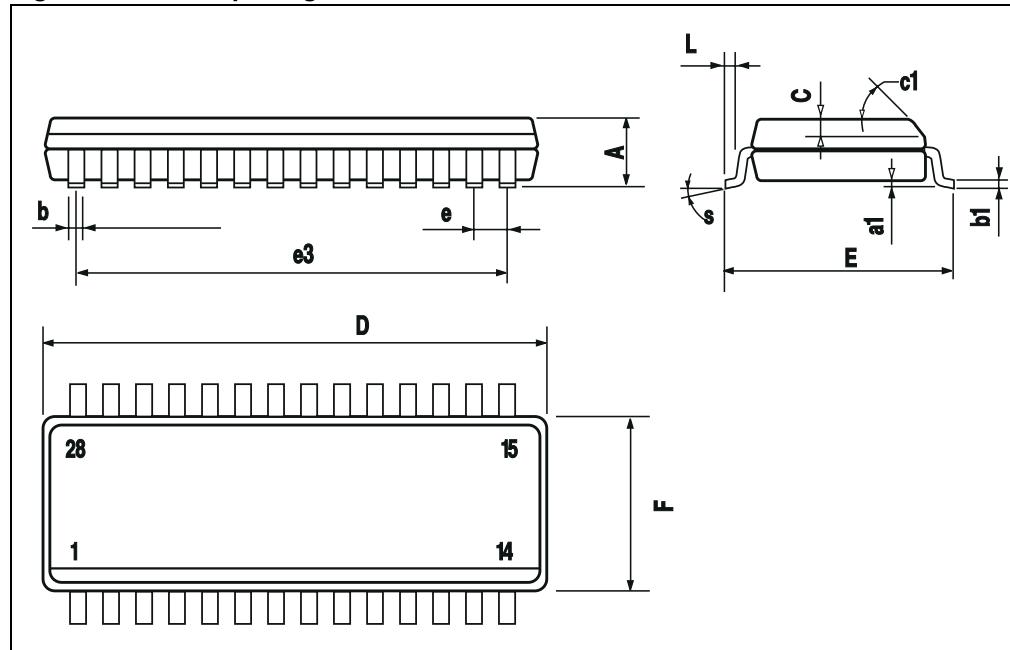

ECOPACK is an ST trademark. ECOPACK specifications are available at: www.st.com.
