

ANALOG PRODUCTS

MC33298 FACT SHEET

POWER ICs
LOW-SIDE SWITCH

APPLICATIONS

- Aircraft Systems
- Marine Systems
- Automotive Systems
- Robotic Systems
- Farm Equipment
- Industrial Actuator Controls
- Fractional Horsepower DC-Motor Controls
- Incandescent Lamp Control
- Applications where Low-Side Switch Control with Diagnostics is Necessary

CUSTOMER BENEFITS

- Low system cost, reduced component count, simplified circuitry, and minimal boardspace
- Simplified system design with direct interfacing to microprocessor
- Directly drives output inductive loads via internally clamped outputs
- Capable of switching capacitive, incandescent, or inductive loads
- Outputs can be operated in parallel for increased output current
- Capable of PWM-ing loads

33298 (0.4 Ω $R_{DS(ON)}$) SMART EIGHT-OUTPUT SWITCH WITH SPI

The 33298 is a smart eight-output low-side power switch. It is a versatile device incorporating an 8-bit serial-in shift register to control an 8-bit parallel output latch providing control of eight independent "ON/OFF" output switches. Applications include the control of solenoids, relays, lamps, small DC-motors, and other moderate current loads (1.0 – 3.0 A).

The 33298 interfaces directly with a microcontroller to control various inductive or incandescent loads. Input control is fast. Data rates are guaranteed to 2.0 MHz but the device is capable of rates to 8.5 MHz @ 25°C.

Each output uses high-efficiency MOSFET power transistors configured with open drains. Each low "ON" resistance output (0.4 Ω $R_{DS(ON)}$ @ 25°C) is capable of sinking up to 3.0 A of transient current. On a continuous basis, each output can simultaneously (with all outputs "ON") handle 0.5 A of current when the device is soldered onto a typical PC board. Higher output currents are dependent on the number of outputs simultaneously "ON". The circuit's innovative monitoring and protection features include very low standby current, "cascadable" fault reporting, independent internal 60 V clamping of outputs, output-specific diagnostics, and independent over temperature shutdown of outputs.

Simplified Application Diagram

Performance	Typical Values
Outputs	8
$R_{DS(ON)}$ @ 25°C	0.4 Ω
Operating Voltage	9.0 – 26.5 V
Peak Current	3.0 A each output
Control	SPI
Operating Temp	-40°C $\leq T_A \leq$ 125°C
Junction Operating Temp	-40°C $\leq T_J \leq$ 150°C

FEATURES

- Outputs clamped when switching inductive loads
- Very low operational bias currents < 2.0 mA
- Sleep mode current < 25 μ A
- CMOS input logic compatible with 5.0 V logic levels
- Load Dump robust (60 V transient at V_{PWR})
- Daisy chain operation of multiple devices possible
- Switch outputs can be paralleled for higher currents
- Additional devices available for comparison in Analog Selector Guide SG1002/D

Protection	Detect	Limiting	Shut Down	Auto Retry	Status Reporting

QUESTIONS

- Do you need to reduce system complexity when switching multiple loads using a microcontroller?
- Do you need high-efficiency switches to control multiple capacitive, incandescent, or inductive loads over a wide temperature range?
- Are you looking for an easy-to-design-in low-side switch, capable of switching eight different loads?
- Do you require a "smart" switch having internal protection features as well as fault reporting?
- Do you need multiple switches that can be controlled from a microcontroller using SPI protocol?
