## LP5551

PowerWise ${ }^{\text {TM }}$ Technology Compliant Energy Management Unit

## General Description

The LP5551 is a PWI 1.0 compliant Energy Management System for reducing power consumption of stand-alone mobile phone processors such as base-band or applications processors.
The LP5551 contains two advanced, digitally controlled switching regulators for supplying variable voltage to processor core and memory. Two regulators provide P - and N - well biasing for threshold scaling applications. The device also integrates 4 programmable LDO-regulators for powering I/O, PLLs and maintaining memory retention in shutdown-mode. The device is controlled via the PWI open-standard interface. The LP5551 operates cooperatively with PowerWise ${ }^{\text {TM }}$ technology compatible processors to optimize supply voltages adaptively over process and temperature variations or dynamically using frequency/voltage pre-characterized look-up tables and provides P - and N -well biasing for threshold scaling.

## Features

- 2300 mA buck regulators operate 180 degrees out of phase for reduced EMI
- 1 MHz PWM switching frequency
- 4 programmable LDOs ideal for I/O (two of these), PLL, and memory retention supply generation.
- Supports high-efficiency PowerWise Technology Adaptive Voltage Scaling
- PWI open standard interface for system power management
- Digitally controlled intelligent voltage scaling
- Auto or PWI controlled PFM mode transition
- Internal soft start/startup sequencing.
- Adjustable P - and N - well bias supply for threshold scaling
- Power OK output.

## Applications

- Dual core processors
- GSM/GPRS/EDGE \& UMTS cellular handsets
- Hand-held radios
- PDAs
- Battery powered devices
- Portable instruments

Note 1: Absolute Maximum Ratings indicate limits beyond which damage to the component may occur. Operating Ratings are conditions under which operation of the device is guaranteed. Operating Ratings do not imply guaranteed performance limits. For guaranteed performance limits and associated test conditions, see the Electrical Characteristics tables.
Note 2: All voltages are with respect to the potential at the GND pin.
Note 3: The Human body model is a 100 pF capacitor discharged through a $1.5 \mathrm{k} \Omega$ resistor into each pin.
The amount of Absolute Maximum power dissipation allowed for the device depends on the ambient temperature and can be calculated using the formula $\mathrm{P}=$ ( TJ - TA) $/ \theta_{\mathrm{JA}}$, (1) where TJ is the junction temperature, TA is the ambient temperature, and JA is the junction-to-ambient thermal resistance.
Junction-to-ambient thermal resistance is highly application and board-layout dependent. In applications where high maximum power dissipation exists, special care must be paid to thermal dissipation issues in board design.
Internal thermal shutdown circuitry protects the device from permanent damage. Thermal shutdown engages at $\mathrm{TJ}=150^{\circ} \mathrm{C}$ (typ.) and disengages at $\mathrm{TJ}=140^{\circ} \mathrm{C}$ (typ.).

Note 4: For detailed soldering specifications and information, please refer to National Semiconductor Application Note 1187: Leadless Leadframe Package (LLP) (AN-1187).
Note 5: In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature (TA-MAX) is dependent on the maximum operating junction temperature (TJ-MAX-OP = $125^{\circ} \mathrm{C}$ ), the maximum power dissipation of the device in the application (PD-MAX), and the junction-to ambient thermal resistance of the part/package in the application ( $\theta_{\mathrm{JA}}$ ), as given by the following equation: TA-MAX $=$ TJ-MAX-OP $-(\theta J A \times P D-M A X)$.
Note 6: Junction-to-ambient thermal resistance ( $\theta \mathrm{JA}$ ) is taken from a thermal modeling result, performed under the conditions and guidelines set forth in the JEDEC standard JESD51-7. The test board is a 4-layer FR-4 board measuring $102 \mathrm{~mm} \times 76 \mathrm{~mm} \times 1.6 \mathrm{~mm}$ with a $2 \times 1$ array of thermal vias. The ground plane on the board is $50 \mathrm{~mm} \times 50 \mathrm{~mm}$. Thickness of copper layers are $36 \mu \mathrm{~m} / 18 \mu \mathrm{~m} / 18 \mu \mathrm{~m} / 36 \mu \mathrm{~m}(1.5 \mathrm{oz} / 1 \mathrm{oz} / 1 \mathrm{oz} / 1.5 \mathrm{oz})$. Ambient temperature in simulation is $22^{\circ} \mathrm{C}$, still air. Power dissipation is 1 W .
Junction-to-ambient thermal resistance is highly application and board-layout dependent. In applications where high maximum power dissipation exists, special care must be paid to thermal dissipation issues in board design.
The value of $\theta_{\mathrm{JA}}$ of this product can vary significantly, depending on PCB material, layout, and environmental conditions. In applications where high maximum power dissipation exists (high VIN, high IOUT), special care must be paid to thermal dissipation issues. For more information on these topics, please refer to Application Note 1187: Leadless Leadframe Package (LLP) and the Power Efficiency and Power Dissipation section of this datasheet.
Note 7: All limits are guaranteed by design, test and/or statistical analysis. All electrical characteristics having room-temperature limits are tested during production with $\mathrm{TJ}=25 \mathrm{C}$. All hot and cold limits are guaranteed by correlating the electrical characteristics to process and temperature variations and applying statistical process control.
Note 8: Capacitors: Low-ESR Surface-Mount Ceramic Capacitors are (MLCCs) used in setting electrical characteristics
Note 9: Guaranteed by design.
Note 10: Dropout voltage is the input-to-output voltage difference at which the output voltage is 100 mV below its nominal value. This specification does not apply in cases it implies operation with an input voltage below the 2.7 V minimum appearing under Operating Ratings. For example, this specification does not apply for devices having 1.5 V outputs because the specification would imply operation with an input voltage at or about 1.5 V
Note 11: Quiescent current for LDO1, LDO2, LDO3, and LDO4 do not include shared functional blocks such as the bandgap reference.
Note 12: The output voltage is guaranteed not to drop more than $15 \mathrm{mV}\left(\mathrm{V}_{\text {OUT }}<\mathrm{V}_{\text {OUT(NOM) }}-15 \mathrm{mV}\right)$ while sinking the specified current.

## LP5551 PWI Register Map

The PWI standard supports sixteen 8-bit registers on the PWI slave. The table below summarizes these registers and shows default register bit values after reset. The following sub-sections provide additional detail on the use of each individual register.

## Summary

| Register Address | Register Name | Register Usage | Type | Reset Default Value |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Operation Description

## DEVICE INFORMATION

The LP5551 is a PowerWise Interface (PWI) compliant power management unit (PMU) for application or baseband processors in mobile phones or other portable equipment. It operates cooperatively with processors using National Semiconductor's Advanced Power Controller (APC) to provide Adaptive or Dynamic Voltage Scaling (AVS, DVS) which drastically improves processor efficiencies compared to conventional power delivery methods. The LP5551 consists of a high efficiency switching DC/DC buck converter to supply the AVS or DVS voltage domain, three LDOs for supplying the logic, PLL, and memory, and PWI registers and logic.

## OPERATION STATE DIAGRAM

The LP5551 has four operating states: Start-up, Active, Sleep and Standby.
The Start-up state is the default state after reset. All regulators are off and PWROK output is ' 0 '. The device will power up when the external enable-input is pulled high. After the powerup sequence LP5551 enters the Active state.
In the Active state all regulators are on and PWROK-output is ' 1 '. Immediately after Start-up the output voltages are at
their default levels. LP5551 can be turned off by supplying the Shutdown command over PWI, or by setting ENABLE and/or RESETN to ' 0 '. The LP5551 can be switched to the Sleep state by issuing the Sleep command.
In the Sleep state the core voltage regulator is off, but the PWROK output is still ' 1 '. The memory voltage regulator (VO3) provides the programmed memory retention voltage. LDO1 and LDO2 are on. The LP5551 can be activated from the Sleep state by giving the Wake-up command. This resumes the last programmed Active state configuration. The device can also be switched off by giving the Shutdown command, or by setting ENABLE and/or RESETN to ' 0 '
In the Shutdown-state all output voltages are ' 0 ', and PWROK-signal is ' 0 ' as well. The LP5551 can exit the Shut-down-state if either ENABLE or RESETN is ' 0 '. In either case the device moves to the Start-up state. See Figure 8.
Figure 6 shows the LP5551 state diagram. The figure assumes that supply voltage to the regulator IC is in the valid range.

FIGURE 6. LP5551 State Diagram

## VOLTAGE SCALING

The LP5551 is designed to be used in a voltage scaling system to lower the power dissipation of baseband or application processors in mobile phones or other portable equipment. By scaling supply voltage with the clock frequency of a processor, dramatic power savings can be achieved. Two types of voltage scaling are supported, dynamic voltage scaling (DVS) and adaptive voltage scaling (AVS). DVS systems switch between pre-characterized voltages which are paired to clock frequencies used for frequency scaling in the processor. AVS systems track the processor performance and optimize the supply voltage to the required performance. AVS is a closed loop system that provides process and temperature compensation such that for any given processor, temperature, or clock frequency, the minimum supply voltage is delivered.

## DIGITALLY CONTROLLED VOLTAGE SCALING

The LP5551 delivers fast, controlled voltage scaling transients with the help of a digital state machine. The state machine automatically optimizes the control loop in the LP5551 switching regulator to provide large signal transients with minimal over- and undershoot. This is an important characteristic for voltage scaling systems that rely on minimal over- and undershoot to set voltages as low as possible and save energy.

## LARGE SIGNAL TRANSIENT RESPONSE

The switching converter in the LP5551 is designed to work in a voltage scaling system. This requires that the converter has a well controlled large signal transient response. Specifically, the under- and over-shoots have to be minimal or zero while maintaining settling times less than 100 usec. Typical response plots are shown in the Typical Performance section.

## PowerWise ${ }^{\text {TM }}$ INTERFACE

To support DVS and AVS, the LP5551 is programmable via the low power, 2 wire PowerWise Interface (PWI). This serial interface controls the various voltages and states of all the regulators in the LP5551. In particular, the switching regulator voltage can be controlled between 0.6 V and 1.2 V in 128 steps (linear scaling). This high resolution voltage control affords accurate temperature and process compensation in AVS. The LDO voltages can also be set, however they are not intended to be dynamic in operation. The LP5551 supports the full command set as described in PWI 1.0 specification:

- Core Voltage Adjust
- Reset
- Sleep
- Shutdown
- Wakeup
- Register Read
- Register Write
- Authenticate
- Synchronize

## PWM/PFM OPERATION

The switching converter in the LP5551 has two modes of operation: pulse width modulation (PWM) and pulse frequency
modulation (PFM). In PWM the converter switches at 1 MHz . Each period can be split into two cycles. During the first cycle, the high-side switch is on and the low-side switch is off, therefore the inductor current is rising. In the second cycle, the high-side switch is off and the low-side switch is on causing the inductor current to decrease. The output ripple voltage is lowest in PWM mode Figure 7. As the load current decreases, the converter efficiency becomes worse due to the increased percentage of overhead current needed to operate in PWM mode. The LP5551 can operate in PFM mode to increase efficiency at low loads.
By default, the part will automatically transition into PFM mode when either of two conditions occurs for a duration of 32 or more clock cycles:
A. The inductor valley current goes below 0 A
B. The peak PMOS switch current drops below the $I_{\text {MODE }}$ level:

$$
\mathrm{I}_{\text {MODE }}<26 \mathrm{~mA}+\frac{\mathrm{V}_{\mathrm{IN}}}{50 \Omega} \text { (typ) }
$$

During PFM operation, the converter positions the output voltage slightly higher than the nominal output voltage during PWM operation, allowing additional headroom for voltage drop during a load transient from light to heavy load. The PFM comparators sense the output voltage via the feedback pin and control the switching of the output FETs such that the output voltage ramps between $0.8 \%$ and $1.6 \%$ (typ) above the nominal PWM output voltage. If the output voltage is below the 'high' PFM comparator threshold, the PMOS power switch is turned on. It remains on until the output voltage exceeds the 'high' PFM threshold or the peak current exceeds the $I_{\text {PFM }}$ level set for PFM mode. The peak current in PFM mode is:

FIGURE 7. Operation in PFM Mode and Transfer to PWM Mode

## Application Information

## PWM/PFM FORCE REGISTER (R9)

By default, the LP5551 automatically transitions between PFM and PWM to optimize efficiency. The PWM/PFM force register (R9) provides the option to override the automatic transition and force PFM or PWM operation (see R9 - PWM/ PFM Force Register declaration). Note that if the operating mode of the regulator is forced to be PFM then the switch current limit is reduced to 100 mA ( 50 mA average load current).

## EN/RESETN

The LP5551 can be shutdown via the ENABLE or RESETN pins, or by issuing a shutdown command from PWI. To disable the LP5551 via hardware (as opposed to the PWI shutdown command), pull the ENABLE and/or the RESETN pin
(s) low. To enable the LP5551, both the ENABLE and the RESETN pins must be high. Once enabled, the LP5551 engages the power-up sequence and all voltages return to their default values.
When using PWI to issue a shutdown command, the PWI will be disabled along with the regulators in the LP5551. To reenable the part, either the ENABLE, RESETN, or both pins must be toggled (high - low - high). The part will then enter the power-up sequence and all voltages will return to their default values. Figure 8 summarizes the ENABLE/RESETN control.
The ENABLE and RESETN pins provide flexibility for system control. In larger systems such as a mobile phone, it can be advantageous to enable/disable a subsystem independently. For example, the LP5551 may be powering the applications processor in a mobile phone. The system controller can power down the applications processor via the ENABLE pin, but leave on other subsystems. When the phone is turned off or in a fault condition, the system controller can have a global reset command that is connected to all the subsystems (RESETN for the LP5551). However, if this type of control is not needed, the ENABLE and RESETN pins can be tied together and used as a single enable/disable pin.

FIGURE 8. ENABLE and RESETN operation

## INDUCTOR

A 4.7uH inductor should be used with the LP5551. The inductor should be rated to handle the peak load current plus the ripple current:

$$
\begin{aligned}
& I_{L(\operatorname{MAX})}=l_{L O A D(M A X)}+\Delta i_{L(M A X)} \\
& =I_{\text {LOAD(MAX })}+\frac{D \times\left(V_{\text {IN(MAX) }}-V_{\text {OUT }}\right)}{2 \times L \times f_{S}} \\
& =I_{\text {LOAD(MAX })}+\frac{\mathrm{Dx}\left(\mathrm{~V}_{\text {IN(MAX) }}-\mathrm{V}_{\text {OUT }}\right)}{9.4}(\mathrm{~A}) \text {, } \\
& \left\{\begin{array}{c}
f_{S}=1 \mathrm{MHz}, \\
L=4.7 \mu \mathrm{H}
\end{array}\right.
\end{aligned}
$$

## CURRENT LIMIT

The switching converter in the LP5551 detects the peak inductor current and limits it for protection (see Electrical Characteristics table and/or Typical Performance section). To determine the average current limit from the peak current limit, the inductor size, input and output voltage, and switching frequency must be known. The LP5551 is designed to work with a 4.7 uH inductor, so:

$$
\begin{aligned}
\mathrm{I}_{\mathrm{CL} \_\mathrm{AVG}} & =\mathrm{I}_{\mathrm{CL} \_P K}-\Delta \mathrm{i}_{\mathrm{L}} \\
& =\mathrm{I}_{\mathrm{CL} \_P K}-\frac{\mathrm{D} \times\left(\mathrm{V}_{\mathrm{IN}}-\mathrm{V}_{\mathrm{OUT}}\right)}{2 \times \mathrm{L} \times \mathrm{f}_{\mathrm{S}}} \\
& \approx 0.4-\frac{\mathrm{D} \times\left(\mathrm{V}_{\mathbb{N}}-V_{\mathrm{OUT}}\right)}{9.4},\left\{\begin{array}{r}
\mathrm{f}_{\mathrm{S}}=1 \mathrm{MHz}, \\
\mathrm{~L}=4.7 \mu \mathrm{H}
\end{array}\right.
\end{aligned}
$$

## INPUT CAPACITOR

The input capacitor to the switching converter supplies the AC switching current drawn from the switching action of the internal power FETs. The input current of a buck converter is discontinuous, so the ripple current supplied by the input capacitor is large. The input capacitor must be rated to handle this current:

$$
I_{\text {RMS_CIN }}=I_{\text {OUT }} \frac{\sqrt{V_{\text {OUT }} \times\left(V_{\text {IN }}-V_{\text {OUT }}\right)}}{V_{\text {IN }}}(A)
$$

The power dissipated in the input capacitor is given by:

$$
P_{D_{-} \mathrm{CIN}}=I_{\text {RMS_CIN }}^{2} \times R_{\text {ESR_CIN }}(W)
$$

The input capacitor must be rated to handle both the RMS current and the dissipated power. A $22 \mu \mathrm{~F}$ ceramic capacitor is recommended for the LP5551.

## OUTPUT CAPACITOR

The switching converters in the LP5551 are designed to be used with a 22 uF ceramic output capacitor. The dielectric should be X5R, X7R, or comparable material to maintain proper tolerances. The output capacitor of the switching converter absorbs the AC ripple current from the inductor and provides the initial response to a load transient. The ripple voltage at the output of the converter is the product of the ripple current flowing through the output capacitor and the impedance of the capacitor. The impedance of the capacitor can be dominated by capacitive, resistive, or inductive elements within the capacitor, depending on the frequency of the
ripple current. Ceramic capacitors are predominately used in portable systems and have very low ESR and remain capacitive up to high frequencies.
The switcher peak - to - peak output voltage ripple in steady state can be calculated as:

## LDO LOADING CAPABILITY

The LDOs in the LP5551 can regulate to a variety of output voltages, depending on the need of the processor. These voltages can be programmed through the PWI. Table 1 summarizes the parameters of the LP5551 LDOs.

$$
V_{P P}=I_{L P P}\left(R_{E S R}+\frac{1}{F_{S} \times 8 \times C_{O U T}}\right)
$$

## LDO INFORMATION

The LDOs included in the LP5551 provide static supply voltages for various functions in the processor. Use the following sections to determine loading and external components.

TABLE 1. LDO Parameters

|  | PWI Register | Output voltage range | Recommended Maximum <br> Output Current | Dropout Voltage <br> (typical) | Typical Load |
| :--- | :--- | :--- | :--- | :--- | :--- |
| LDO1 | R8 | $0.6 \mathrm{~V}-2.2 \mathrm{~V}$ | 100 mA | 200 mV | PLL |
| LDO2 | R7 | $1.5 \mathrm{~V}-3.3 \mathrm{~V}$ | 250 mA | 150 mV | I/O |
| LDO3 | R2 | $\mathrm{V}_{\text {Osw }}+0.05 \mathrm{~V} 1$ <br> $0.7 \mathrm{~V}-1.35 \mathrm{~V} 2$ | 50 mA | 200 mV | Memory/Memory <br> retention |
| LDO4 | R12 | $1.5 \mathrm{~V}-3.3 \mathrm{~V}$ | 250 mA | 150 mV | User defined |

1. LDO3 tracks the switching converter output voltage $\left(\mathrm{V}_{\mathrm{Osw}}\right)$ plus a 50 mV offset when the LP5551 is in active state.
2. LDO3 regulates at the set memory retention voltage when the LP5551 is in shutdown state.

## LDO OUTPUT CAPACITOR

The output capacitor sets a low frequency pole and a high frequency zero in the control loop of an LDO. The capacitance and the equivalent series resistance (ESR) of the capacitor must be within a specified range to meet stability require-
ments. The LDOs in the LP5551 are designed to be used with ceramic output capacitors. The dielectric should be X5R, X7R, or comparable material to maintain proper tolerances. Use the following table to choose a suitable output capacitor:

TABLE 2. Output Capacitor Selection Guide

|  | Output Capacitance Range (Recommended Typical Value) | ESR range |
| :--- | :--- | :--- |
| LDO1 | $1 \mu \mathrm{~F}-20 \mu \mathrm{~F}(2.2 \mu \mathrm{~F})$ | $5 \mathrm{mohm}-500 \mathrm{mohm}$ |
| LDO2 | $2 \mu \mathrm{~F}-20 \mu \mathrm{~F}(4.7 \mu \mathrm{~F})$ | $5 \mathrm{mohm}-500 \mathrm{mohm}$ |
| LDO3 | $0.7 \mu \mathrm{~F}-2.2 \mu \mathrm{~F}(1.0 \mu \mathrm{~F})$ | $5 \mathrm{mohm}-500 \mathrm{mohm}$ |
| LDO4 | $2 \mu \mathrm{~F}-20 \mu \mathrm{~F}(4.7 \mu \mathrm{~F})$ | 5 mohm -500 mohm |

#### Abstract

THE CONTENTS OF THIS DOCUMENT ARE PROVIDED IN CONNECTION WITH NATIONAL SEMICONDUCTOR CORPORATION ("NATIONAL") PRODUCTS. NATIONAL MAKES NO REPRESENTATIONS OR WARRANTIES WITH RESPECT TO THE ACCURACY OR COMPLETENESS OF THE CONTENTS OF THIS PUBLICATION AND RESERVES THE RIGHT TO MAKE CHANGES TO SPECIFICATIONS AND PRODUCT DESCRIPTIONS AT ANY TIME WITHOUT NOTICE. NO LICENSE, WHETHER EXPRESS, IMPLIED, ARISING BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. testing and other quality controls are used to the extent national deems necessary to support NATIONAL'S PRODUCT WARRANTY. EXCEPT WHERE MANDATED BY GOVERNMENT REQUIREMENTS, TESTING OF ALL PARAMETERS OF EACH PRODUCT IS NOT NECESSARILY PERFORMED. NATIONAL ASSUMES NO LIABILITY FOR APPLICATIONS ASSISTANCE OR BUYER PRODUCT DESIGN. BUYERS ARE RESPONSIBLE FOR THEIR PRODUCTS AND APPLICATIONS USING NATIONAL COMPONENTS. PRIOR TO USING OR DISTRIBUTING ANY PRODUCTS THAT INCLUDE NATIONAL COMPONENTS, BUYERS SHOULD PROVIDE ADEQUATE DESIGN, TESTING AND OPERATING SAFEGUARDS. EXCEPT AS PROVIDED IN NATIONAL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, NATIONAL ASSUMES NO LIABILITY WHATSOEVER, AND NATIONAL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY RELATING TO THE SALE AND/OR USE OF NATIONAL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

## LIFE SUPPORT POLICY

NATIONAL'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS PRIOR WRITTEN APPROVAL OF THE CHIEF EXECUTIVE OFFICER AND GENERAL COUNSEL OF NATIONAL SEMICONDUCTOR CORPORATION. As used herein:

Life support devices or systems are devices which (a) are intended for surgical implant into the body, or (b) support or sustain life and whose failure to perform when properly used in accordance with instructions for use provided in the labeling can be reasonably expected to result in a significant injury to the user. A critical component is any component in a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system or to affect its safety or effectiveness.
