

General Description

Ideal for space critical applications, the LM4040 and LM4041 precision voltage references are available in the subminiature (3mm × 1.3mm) SOT-23 surface-mount package.

The LM4040 is available in fixed reverse breakdown voltages of 2.500V, 4.096V and 5.000V. The LM4041 is available with a fixed 1.225V or an adjustable reverse breakdown voltage.

The minimum operating current ranges from 60µA for the LM4041-1.2 to 74µA for the LM4040-5.0. LM4040 versions have a maximum operating current of 15mA. LM4041 versions have a maximum operating current of 12mA.

The LM4040 and LM4041 have bandgap reference temperature drift curvature correction and low dynamic impedance, ensuring stable reverse breakdown voltage accuracy over a wide range of operating temperatures and currents.

Data sheets and support documentation can be found on Micrel's web site at www.micrel.com.

Features

- Small SOT-23 package
- No output capacitor required
- Tolerates capacitive loads
- Fixed reverse breakdown voltages of 1.225, 2.500V, 4.096V and 5.000V
- Adjustable reverse breakdown version
- Contact Micrel for parts with extended temperature range.

Key Specifications

- Output voltage tolerance ±0.1% (max)
- Low output noise (10Hz to 100Hz)
 - LM4040 35µV_{RMS} (typ)
 - LM4041 20µV_{RMS} (typ)
- Wide operating current range
 - LM4040 60µA to 15mA
 - LM4041 60µA to 12mA
- Industrial temperature range -40°C to +85°C
- Low temperature coefficient 100ppm/°C (max)

Applications

- Battery-powered equipment
- Data acquisition systems
- Instrumentation
- Process control
- Energy management
- Product testing
- Automotive electronics
- Precision audio components

Typical Applications

Figure 1. LM4040, LM4041 Fixed Shunt Regulator Application

Figure 2. LM4041 Adjustable Shunt Regulator Application

Pin Configuration

Pin 3 must float or be connected to pin 2.

LM4041 Adjustable

Absolute Maximum Ratings

Reverse Current	20mA
Forward Current	10mA
Maximum Output Voltage	
LM4041-Adjustable	15V
Power Dissipation at $T_A = 25^\circ\text{C}$ (Note 2)	306mW
Storage Temperature	-65°C to $+150^\circ\text{C}$
Lead Temperature	
Vapor phase (60 seconds)	$+215^\circ\text{C}$
Infrared (15 seconds)	$+220^\circ\text{C}$
ESD Susceptibility	
Human Body Model (Note 3)	2kV
Machine Model (Note 3)	200V

Operating Ratings (Notes 1 and 2)

Temperature Range	
($T_{\text{MIN}} \leq T_A \leq T_{\text{MAX}}$)	$-40^\circ\text{C} \leq T_A \leq +85^\circ\text{C}$
Reverse Current	
LM4040-2.5	60 μA to 15mA
LM4040-4.1	68 μA to 15mA
LM4040-5.0	74 μA to 15mA
LM4041-1.2	60 μA to 12mA
LM4041-ADJ	60 μA to 12mA
Output Voltage Range	
LM4041-ADJ	1.24V to 10V

- Note 1.** Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is functional, but do not guarantee specific performance limits. For guaranteed specification and test conditions, see the "Electrical Characteristics". The guaranteed specifications apply only for the test conditions listed. Some performance characteristics may degrade when the device is not operated under the listed test conditions.
- Note 2.** The maximum power dissipation must be derated at elevated temperatures and is dictated by T_{JMAX} (maximum junction temperature), θ_{JA} (junction to ambient thermal resistance), and T_A (ambient temperature). The maximum allowable power dissipation at any temperature is $\text{PD}_{\text{MAX}} = (T_{\text{JMAX}} - T_A) / \theta_{\text{JA}}$ or the number given in the Absolute Maximum Ratings, whichever is lower. For the LM4040 and LM4041, $T_{\text{JMAX}} = 125^\circ\text{C}$, and the typical thermal resistance (θ_{JA}), when board mounted, is $326^\circ\text{C}/\text{W}$ for the SOT-23 package.
- Note 3.** The human body model is a 100pF capacitor discharged through a 1.5k Ω resistor into each pin. The machine model is a 200pF capacitor discharged directly into each pin.

LM4040-2.5 Electrical Characteristics (Note 4)

Boldface limits apply for $T_A = T_J = T_{MIN}$ to T_{MAX} ; all other limits $T_A = T_J = 25^\circ\text{C}$. The grades C and D designate initial Reverse Breakdown Voltage tolerance of $\pm 0.5\%$ and $\pm 1.0\%$ respectively.

Symbol	Parameter	Conditions (Note 5)	Typical Limits	LM4040CIM3	LM4040DIM3	Units
				Limits (Note 6)	(Limit) (Note 6)

e_N	Wideband Noise	$I_R = 100\mu\text{A}$ $10\text{Hz} \leq f \leq 10\text{kHz}$	35			μV_{RMS}
ΔV_R	Reverse Breakdown Voltage Long Term Stability	$t = 1000\text{hrs}$ $T = 25^\circ\text{C} \pm 0.1^\circ\text{C}$ $I_R = 100\mu\text{A}$	120			ppm

Note 4. Specification for packaged product only.

Note 5. Typicals are at $T_J = 25^\circ\text{C}$ and represent most likely parametric norm.

Note 6. Limits are 100% production tested at 25°C . Limits over temperature are guaranteed through correlation using Statistical Quality Control (SQL) methods.

Note 7. The boldface (over temperature limit for Reverse Breakdown Voltage Tolerance is defined as the room temperature Reverse Breakdown Voltage Tolerance $\pm[(\Delta V_R/\Delta T)(65^\circ\text{C})(V_R)]$. $\Delta V_R/\Delta T$ is the V_R temperature coefficient, 65°C is the temperature range from -40°C to the reference point of 25°C , and V_R is the reverse breakdown voltage. The total over temperature tolerance for the different grades follows:

C-grade: $\pm 1.15\% = \pm 0.5\% \pm 100\text{ppm}/^\circ\text{C} \times 65^\circ\text{C}$

D-grade: $\pm 1.98\% = \pm 1.0\% \pm 150\text{ppm}/^\circ\text{C} \times 65^\circ\text{C}$

Example: The C-grade LM4040-2.5 has an over temperature Reverse Breakdown Voltage tolerance of $\pm 2.5 \times 1.15\% = \pm 29\text{mV}$.

LM4040-4.1 Electrical Characteristics (Note 4)

Boldface limits apply for $T_A = T_J = T_{MIN}$ to T_{MAX} ; all other limits $T_A = T_J = 25^\circ\text{C}$. The grades C and D designate initial Reverse Breakdown Voltage tolerance of $\pm 0.5\%$ and $\pm 1.0\%$ respectively.

Note 4. Specification for packaged product only.

Note 5. Typicals are at $T_J = 25^\circ\text{C}$ and represent most likely parametric norm.

Note 6. Limits are 100% production tested at 25°C . Limits over temperature are guaranteed through correlation using Statistical Quality Control (SQL) methods.

Note 7. The boldface (over temperature limit for Reverse Breakdown Voltage Tolerance is defined as the room temperature Reverse Breakdown Voltage Tolerance $\pm[(\Delta V_R/\Delta T)(65^\circ\text{C})(V_R)]$. $\Delta V_R/\Delta T$ is the V_R temperature coefficient, 65°C is the temperature range from -40°C to the reference point of 25°C , and V_R is the reverse breakdown voltage. The total over temperature tolerance for the different grades follows:

C-grade: $\pm 1.15\% = \pm 0.5\% \pm 100\text{ppm}/^\circ\text{C} \times 65^\circ\text{C}$

D-grade: $\pm 1.98\% = \pm 1.0\% \pm 150\text{ppm}/^\circ\text{C} \times 65^\circ\text{C}$

Example: The C-grade LM4040-2.5 has an over temperature Reverse Breakdown Voltage tolerance of $\pm 2.5 \times 1.15\% = \pm 29\text{mV}$.

Note 8. When $V_{OUT} \leq 1.6\text{V}$, the LM4041-ADJ must operate at reduced I_R . This is caused by the series resistance of the die attach between the die (-) output and the package (-) output pin. See the Output Saturation curve in the "Typical Performance Characteristics" section.

Note 9. Reference voltage and temperature coefficient will change with output voltage. See "Typical Performance Characteristics" curves.

Applications Information

The stable operation of the LM4040 and LM4041 references requires an external capacitor greater than 10nF connected between the (+) and (-) pins. Bypass capacitors with values between 100pF and 10nF have been found to cause the devices to exhibit instabilities.

Schottky Diode

LM4040-x.x and LM4041-1.2 in the SOT-23 package have a parasitic Schottky diode between pin 2 (-) and pin 3 (die attach interface connect). Pin 3 of the SOT-23 package must float or be connected to pin 2. LM4041-ADJs use pin 3 as the (-) output.

Conventional Shunt Regulator

In a conventional shunt regulator application (see Figure 1), an external series resistor (R_S) is connected between the supply voltage and the LM4040-x.x or LM4041-1.2 reference. R_S determines the current that flows through the load (I_L) and the reference (I_Q). Since load current and supply voltage may vary, R_S should be small enough to supply at least the minimum acceptable I_Q to the reference even when the supply voltage is at its minimum and the load current is at its maximum value. When the supply voltage is at its maximum and I_L is at its minimum, R_S should be large enough so that the current flowing through the LM4040-x.x is less than 15mA, and the current flowing through the LM4041-1.2 or LM4041-ADJ is less than 12mA.

R_S is determined by the supply voltage (V_S), the load and operating current, (I_L and I_Q), and the reference's reverse breakdown voltage (V_R):

$$R_S = (V_S - V_R) / (I_L + I_Q)$$

Adjustable Regulator

The LM4041-ADJ's output voltage can be adjusted to any value in the range of 1.24V through 10V. It is a function of the internal reference voltage (V_{REF}) and the ratio of the external feedback resistors as shown in Figure 2. The output is found using the equation:

$$(1) \quad V_O = V_{REF} [(R2/R1) + 1]$$

where V_O is the desired output voltage. The actual value of the internal V_{REF} is a function of V_O . The "corrected" V_{REF} is determined by:

$$(2) \quad V_{REF}' = V_O (\Delta V_{REF} / \Delta V_O) + V_Y$$

where V_O is the desired output voltage. $\Delta V_{REF} / \Delta V_O$ is found in the "Electrical Characteristics" and is typically -1.3mV/V and V_Y is equal to 1.233V. Replace the value of V_{REF} in equation (1) with the value V_{REF}' found using equation (2).

Note that actual output voltage can deviate from that predicted using the typical $\Delta V_{REF} / \Delta V_O$ in equation (2); for C-grade parts, the worst-case $\Delta V_{REF} / \Delta V_O$ is -2.5mV/V and $V_Y = 1.248\text{V}$.

The following example shows the difference in output voltage resulting from the typical and worst case values of $\Delta V_{REF} / \Delta V_O$.

Let $V_O = +9\text{V}$. Using the typical values of $\Delta V_{REF} / \Delta V_O$, V_{REF} is 1.223V. Choosing a value of $R1 = 10\text{k}\Omega$, $R2 = 63.272\text{k}\Omega$. Using the worst case $\Delta V_{REF} / \Delta V_O$ for the C-grade and D-grade parts, the output voltage is actually 8.965V and 8.946V respectively. This results in possible errors as large as 0.39% for the C-grade parts and 0.59% for the D-grade parts. Once again, resistor values found using the typical value of $\Delta V_{REF} / \Delta V_O$ will work in most cases, requiring no further adjustment.
