

Low-Power, Low-Drift, +2.5V/+5V/+10V Precision Voltage References

MAX873/MAX875/MAX876

General Description

The MAX873/MAX875/MAX876 precision 2.5V, 5V, and 10V references offer excellent accuracy and very low power consumption. Extremely low temperature drift combined with excellent line and load regulation permit stable operation over a wide range of electrical and environmental conditions. Operation for the MAX873 is guaranteed with a +4.5V supply, making the part ideal in systems running from a +5V ±10% supply. Low 10Hz to 1kHz noise—typically 15µVRMS, 30µVRMS, and 60µVRMS, respectively, for the MAX873, MAX875, and MAX876—make the parts suitable for 12-bit data-acquisition systems.

A TRIM pin facilitates adjustment of the reference voltage over a 4% range, using only a 100kΩ potentiometer. A voltage output proportional to temperature provides a source for temperature compensation circuits, temperature warning circuits, and other applications.

Applications

- 12-Bit A/D and D/A Converters
- Digital Multimeters
- Portable Data-Acquisition Systems
- Low-Power Test Equipment

Pin Configuration

Features

- ◆ MAX873/MAX875/MAX876
+2.5V/+5V/+10V Outputs
±1.5mV/±2.0mV/±3.0mV Max Initial Accuracy
±2.5mV/±4mV/±7mV Max Error Over Temperature
- ◆ 7ppm/°C (Max) Temperature Coefficient
- ◆ 280µA (Max) Quiescent Current
- ◆ Sources 10mA, Sinks 2mA
- ◆ 15ppm/mA Load Regulation (Max)
- ◆ 4ppm/V Line Regulation (Max)
- ◆ Wide Supply Voltage Range, +4.5V to +18V (MAX873)
- ◆ TEMP Output Proportional to Temperature

Low-Power, Low-Drift, +2.5V /+5V/+10V Precision Voltage References

ABSOLUTE MAXIMUM RATINGS

VCC to GND 20V
 VOUT, TRIM, TEMP, TEST (GND - 0.3V) to (VCC + 0.3V)
 Output Short-Circuit Duration (to GND) Continuous
 Current into Any Pin ±50mA
 Continuous Power Dissipation (TA = +70°C)
 Plastic DIP (derate 9.09mW/°C above +70°C) 727mW
 SO (derate 5.88mW/°C above +70°C) 471mW
 CERDIP (derate 8.00mW/°C above +70°C) 640mW

Operating Temperature Ranges:

MAX87__C_A 0°C to +70°C
 MAX87__E_A -40°C to +85°C
 MAX87__MJA -55°C to +125°C
 Storage Temperature Range -65°C to +150°C
 Lead Temperature (soldering, 10 sec) +300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Pin Description

| PIN | NAME | FUNCTION |
|-----|------------------|--|
| 1,8 | TEST | For factory test use only. Make no connections to these pins. |
| 2 | V _{IN} | Supply Voltage |
| 3 | TEMP | Temperature Proportional Output Voltage. Generates a voltage proportional to the temperature of the die. |
| 4 | GND | Ground |
| 5 | TRIM | Output Voltage Trim. Connect to the center of a voltage divider for trimming; otherwise, make no connection. |
| 6 | V _{OUT} | Output Voltage |
| 7 | N.C. | No Connect - not internally connected. |

Detailed Description

The bipolar MAX873, MAX875, and MAX876 are bandgap references, amplified to give an output voltage of 2.500V, 5.000V, and 10.000V, respectively. Laser trimming is used to adjust the output voltage and minimize thermal drift. Post-package trimming allows control of the output to within $\pm 1.5\text{mV}$, $\pm 2.0\text{mV}$, and $\pm 3.0\text{mV}$, respectively.

The MAX873, MAX875, and MAX876 are essentially three-terminal references with a power-supply input, ground, and reference output. Additionally, a TRIM pin facilitates adjustment of the reference voltage over a 4% range using only a 100k Ω potentiometer. A voltage output proportional to temperature provides a source for temperature compensation circuits, temperature warning circuits, and other applications.

Applications Information

Input Bypassing

For best transient performance, decouple the input with a 10 μF electrolytic capacitor in parallel with a 0.01 μF to 0.1 μF ceramic capacitor as shown in Figure 1. Where transient performance is less important, a single 0.1 μF capacitor is sufficient.

Output Bypassing

These devices perform well with no output decoupling capacitance. However, if the capacitive load on the output exceeds 100pF, bypass the output with at least 1 μF to ensure stability. A 10 μF electrolytic capacitor in parallel with a 0.01 μF to 0.1 μF ceramic capacitor provides excellent load-transient performance and guarantees stability as shown in Figure 1.

Figure 1. Recommended Bypassing for Good High-Frequency Response

Standard Application

The standard application for the references is shown in the *Typical Operating Circuit*. Additional bypassing, shown in Figure 1, provides superior performance over a range of conditions.

Output-Voltage Trimming

Use a 100k Ω potentiometer as shown in Figure 2 to trim the output voltage to the desired level. A trim range of $\pm 95\text{mV}$ (MAX873), $\pm 200\text{mV}$ (MAX875), or $\pm 400\text{mV}$ (MAX876) is available using this technique. Large adjustments of the output voltage may degrade its temperature coefficient by as much as 5ppm/ $^{\circ}\text{C}$.

Low-Power, Low-Drift, +2.5V/+5V/+10V Precision Voltage References

MAX873/MAX875/MAX876

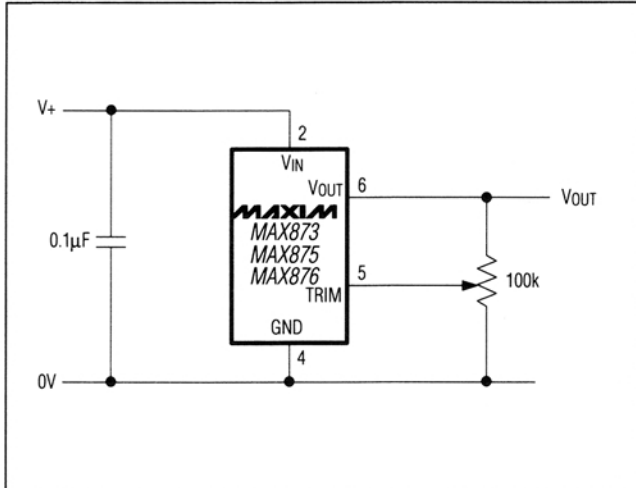

Figure 2. Output-Voltage Trim Circuit

Figure 4. Low-Dropout -2.5V Reference

Inverting Applications

+2.5V and -2.5V reference voltages can be generated using the MAX873 with an op amp in the traditional gain of -1 configuration shown in Figure 3. The accuracy of this circuit depends on the matching of the two resistors R and R' . A similar configuration using the MAX875 and MAX876 can provide $\pm 5V$ and $\pm 10V$ references, respectively.

Figure 3. +2.5V and -2.5V Outputs

The circuit in Figure 4 requires no resistors and suffers only from offset and temperature coefficient errors of the op amp itself. The op amp also buffers the reference, so the output capability of this circuit depends on the performance of the op amp selected. In addition, the dropout performance of this circuit is very good: the positive rail can go down to about 1.5V because the MAX873 is unloaded, and the negative rail can decline typically to -3.2V using a MAX480, or to -2.6V using an ICL7611 ($I_Q = 100\mu A$ mode). A similar configuration using the MAX875 or MAX876 can generate -5.0V or -10.0V references, respectively.

Temperature Measurement

The TEMP output delivers a voltage proportional to the absolute temperature of the die. In packaged parts, this closely approximates the ambient temperature of the device because the power dissipation of the reference itself is very small. The temperature coefficient of this output is typically $2mV/^\circ C$, and the nominal voltage at $+25^\circ C$ is 608mV (*Typical Operating Characteristics*).
