## 2K x 8 Static RAM

## Features

- Automatic power-down when deselected
- CMOS for optimum speed/power
- High speed
- 15 ns
- Low active power
- 660 mW (commercial)
—688 mW (military-20 ns)
- Low standby power
- 110 mW (20 ns)
- TTL-compatible inputs and outputs
- Capable of withstanding greater than 2001V electrostatic discharge
- $\mathrm{V}_{\mathrm{IH}}$ of 2.2 V

## Functional Description

The CY7C128A is a high-performance CMOS static RAM organized as 2048 words by 8 bits. Easy memory expansion is
provided by an active LOW Chip Enable ( $\overline{\mathrm{CE}}$ ), and active LOW Output Enable ( $\overline{\mathrm{OE}}$ ) and three-state drivers. The CY7C128A has an automatic power-down feature, reducing the power consumption by $83 \%$ when deselected.
Writing to the device is accomplished when the Chip Enable ( $\overline{\mathrm{CE}}$ ) and Write Enable ( $\overline{\mathrm{WE})}$ inputs are both LOW.
Data on the eight I/O pins ( $\mathrm{I} / \mathrm{O}_{0}$ through $\mathrm{I} / \mathrm{O}_{7}$ ) is written into the memory location specified on the address pins ( $A_{0}$ through $\mathrm{A}_{10}$ ).
Reading the device is accomplished by taking Chip Enable ( $\overline{\mathrm{CE}}$ ) and Output Enable ( $\overline{\mathrm{OE}}$ ) LOW while Write Enable ( $\overline{\mathrm{WE}}$ ) remains HIGH. Under these conditions, the contents of the memory location specified on the address pins will appear on the eight I/O pins.
The I/O pins remain in high-impedance state when Chip Enable ( $\overline{\mathrm{CE}}$ ) or Output Enable $(\overline{\mathrm{OE}})$ is HIGH or Write Enable (WE) is LOW.
The CY7C128A utilizes a die coat to insure alpha immunity.

1. $\mathrm{T}_{\mathrm{A}}$ is the "instant on" case temperature.
2. See the last page of this specification for Group A subgroup testing information.
3. $\mathrm{V}_{\mathrm{IL}}(\mathrm{min})=.-3.0 \mathrm{~V}$ for pulse durations less than 30 ns .
4. Not more than 1 output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds
5. Tested initially and after any design or process changes that may affect these parameters.

## Notes:

6. Test conditions assume signal transition time of 5 ns or less, timing reference levels of 1.5 V , input pulse levels of 0 to 3.0 V , and output loading of the specified $\mathrm{l}_{\mathrm{OL}} / \mathrm{l}_{\mathrm{OH}}$ and $30-\mathrm{pF}$ load capacitance.
7. $t_{H Z O E}, t_{H Z C E}$, and $t_{H Z W E}$ are specified with $C_{L}=5 \mathrm{pF}$ as in part (b) of AC Test Loads. Transition is measured $\pm 500 \mathrm{mV}$ from steady state voltage.
8. At any given temperature and voltage condition, $\mathrm{t}_{\text {HZCE }}$ is less than $\mathrm{t}_{\text {LZCE }}$ for any given device.
9. The internal write time of the memory is defined by the overlap of CE LOW and WE LOW. Both signals must be LOW to initiate a write and either signal can terminate a write by going HIGH. The data input set-up and hold timing should be referenced to the rising edge of the signal that terminates the write.

## Notes:

10. $\overline{\mathrm{WE}}$ is HIGH for read cycle.
11. Device is continuously selected. $\overline{\mathrm{OE}}, \overline{\mathrm{CE}}=\mathrm{V}_{\mathrm{IL}}$.
12. Address valid prior to or coincident with CE transition LOW
13. Data I/O pins enter high-impedance state, as shown, when $\overline{\mathrm{OE}}$ is held LOW during write.

Notes:
14. If $\overline{\mathrm{CE}}$ goes HIGH simultaneously with $\overline{\mathrm{WE}}$ HIGH, the output remains in a high-impedance state.
