# 4-Mb (256K x 18) Pipelined Sync SRAM 

## Features

- Registered inputs and outputs for pipelined operation
- $256 \mathrm{~K} \times 18$ common I/O architecture
- 3.3 V core power supply
- 3.3V / 2.5V I/O operation
- Fast clock-to-output times
- 2.6 ns (for $250-\mathrm{MHz}$ device)
- 2.6 ns (for 225-MHz device)
- 2.8 ns (for 200-MHz device)
- 3.5 ns (for $166-\mathrm{MHz}$ device)
- 4.0 ns (for $133-\mathrm{MHz}$ device)
- 4.5 ns (for $100-\mathrm{MHz}$ device)
- Provide high-performance 3-1-1-1 access rate
- User-selectable burst counter supporting Intel ${ }^{\circledR}$ Pentium interleaved or linear burst sequences
- Separate processor and controller address strobes
- Synchronous self-timed writes
- Asynchronous output enable
- Offered in JEDEC-standard 100-pin TQFP and 119 Ball BGA packages.
- "ZZ" Sleep Mode Option

## Functional Description ${ }^{[1]}$

The CY7C1327F SRAM integrates $262,144 \times 18$ SRAM cells with advanced synchronous peripheral circuitry and a two-bit counter for internal burst operation. All synchronous inputs are gated by registers controlled by a positive-edge-triggered Clock Input (CLK). The synchronous inputs include all addresses, all data inputs, address-pipelining Chip Enable ( $\overline{\mathrm{CE}}_{1}$ ), depth-expansion Chip Enables $\left(\mathrm{CE}_{2}\right.$ and $\overline{\mathrm{CE}}_{3}$ ), Burst Control inputs ( $\overline{\mathrm{ADSC}}, \overline{\mathrm{ADSP}}$, and $\overline{\mathrm{ADV}}$ ), Write Enables ( $\overline{B W}_{[A: B]}$, and $\left.\overline{\mathrm{BWE}}\right)$, and Global Write (GW). Asynchronous inputs include the Output Enable ( $\overline{\mathrm{OE}}$ ) and the ZZ pin.
Addresses and chip enables are registered at rising edge of clock when either Address Strobe Processor ( $\overline{\mathrm{ADSP}}$ ) or Address Strobe Controller ( $\overline{\mathrm{ADSC}}$ ) are active. Subsequent burst addresses can be internally generated as controlled by the Advance pin ( $\overline{\mathrm{ADV}}$ ).
Address, data inputs, and write controls are registered on-chip to initiate a self-timed Write cycle. This part supports Byte Write operations (see Pin Descriptions and Truth Table for further details). Write cycles can be one to two bytes wide as controlled by the byte write control inputs. GW when active LOW causes all bytes to be written.
The CY7C1327F operates from a +3.3 V core power supply while all outputs also operate with a +3.3 V or a +2.5 V supply. All inputs and outputs are JEDEC-standard JESD8-5-compatible.

## Pin Definitions

| Name | TQFP | BGA | I/O | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{A}_{0}, \mathrm{~A}_{1}, \mathrm{~A}$ | 37,36, $32,33,34$, $35,44,45$, $46,47,48$, $49,50,80$, $81,82,99$, 100 | $\begin{aligned} & \text { P4,N4,A2, } \\ & \text { C2,R2,T2, } \\ & \text { A3,B3,C3, } \\ & \text { T3,A5,B5, } \\ & \text { C5,T5,A6, } \\ & \text { C6,R6,T6 } \end{aligned}$ | Input- <br> Synchronous | Address Inputs used to select one of the 256 K address locations. Sampled at the rising edge of the CLK if ADSP or $\overline{\mathrm{ADSC}}$ is active LOW, and $\overline{\mathrm{CE}}_{1}$, $C E_{2}$, and $\overline{C E}_{3}$ are sampled active. A1, A0 feed the 2-bit counter. |
| $\overline{\mathrm{BW}}_{\mathrm{A},} \overline{\mathrm{BW}}_{\mathrm{B}}$ | 93,94 | L5,G3 | InputSynchronous | Byte Write Select Inputs, active LOW. Qualified with BWE to conduct byte writes to the SRAM. Sampled on the rising edge of CLK. |
| $\overline{\mathrm{GW}}$ | 88 | H4 | InputSynchronous | Global Write Enable Input, active LOW. When asserted LOW on the rising edge of CLK, a global write is conducted (ALL bytes are written, regardless of the values on $\overline{\mathrm{BW}}_{[\mathrm{A}: \mathrm{B}]}$ and $\left.\overline{\mathrm{BWE}}\right)$. |
| $\overline{\text { BWE }}$ | 87 | M4 | InputSynchronous | Byte Write Enable Input, active LOW. Sampled on the rising edge of CLK. This signal must be asserted LOW to conduct a byte write. |
| CLK | 89 | K4 | InputClock | Clock Input. Used to capture all synchronous inputs to the device. Also used to increment the burst counter when ADV is asserted LOW, during a burst operation. |
| $\overline{\mathrm{CE}}_{1}$ | 98 | E4 | InputSynchronous | Chip Enable 1 Input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with $\mathrm{CE}_{2}$ and $\overline{\mathrm{CE}}_{3}$ to select/deselect the device. $\overline{\mathrm{ADSP}}$ is ignored if $\overline{\mathrm{CE}}_{1}$ is HIGH. |
| $\mathrm{CE}_{2}$ | 97 | B2 | InputSynchronous | Chip Enable 2 Input, active HIGH. Sampled on the rising edge of CLK. Used in conjunction with $\overline{\mathrm{CE}}_{1}$ and $\overline{\mathrm{CE}}_{3}$ to select/deselect the device. |
| $\overline{\mathrm{CE}}_{3}$ | 92 | B6 | InputSynchronous | Chip Enable 3 Input, active LOW. Sampled on the rising edge of CLK. Used in conjunction with $\overline{\mathrm{CE}}_{1}$ and $\mathrm{CE}_{2}$ to select/deselect the device. Not connected for BGA. Where referenced, $\overline{\mathrm{CE}}_{3}$ is assumed active throughout this document for BGA. |
| $\overline{\mathrm{OE}}$ | 86 | F4 | InputAsynchronous | Output Enable, asynchronous input, active LOW. Controls the direction of the I/O pins. When LOW, the I/O pins behave as outputs. When deasserted HIGH, I/O pins are three-stated, and act as input data pins. $\overline{\mathrm{OE}}$ is masked during the first clock of a read cycle when emerging from a deselected state. |
| $\overline{\text { ADV }}$ | 83 | G4 | InputSynchronous | Advance Input signal, sampled on the rising edge of CLK, active LOW. When asserted, it automatically increments the address in a burst cycle. |
| $\overline{\text { ADSP }}$ | 84 | A4 | InputSynchronous | Address Strobe from Processor, sampled on the rising edge of CLK, active LOW. When asserted LOW, A is captured in the address registers. A1, A0 are also loaded into the burst counter. When $\overline{\mathrm{ADSP}}$ and $\overline{\mathrm{ADSC}}$ are both asserted, only $\overline{\text { ADSP }}$ is recognized. $\overline{\text { ASDP }}$ is ignored when $\overline{C E}_{1}$ is deasserted HIGH. |
| ZZ | 64 | T7 | InputAsynchronous | ZZ "sleep" Input, active HIGH. This input, when High places the device in a non-time-critical "sleep" condition with data integrity preserved. For normal operation, this pin has to be LOW or left floating. ZZ pin has an internal pull-down. |
| $\overline{\text { ADSC }}$ | 85 | B4 | InputSynchronous | Address Strobe from Controller, sampled on the rising edge of CLK, active LOW. When asserted LOW, A is captured in the address registers. $\mathrm{A} 1, \mathrm{~A} 0$ are also loaded into the burst counter. When $\overline{\mathrm{ADSP}}$ and $\overline{\mathrm{ADSC}}$ are both asserted, only $\overline{\text { ADSP }}$ is recognized. |
| $\begin{gathered} \mathrm{DQ}_{\mathrm{A}}, \\ \mathrm{DQ}_{\mathrm{B}} \\ \\ \\ \\ \mathrm{DQP}_{\mathrm{A}}, \\ \mathrm{DQP}_{\mathrm{B}} \end{gathered}$ | $\begin{gathered} \hline 58,59,62, \\ 63,68,69, \\ 72,73 \\ 8,9,12,13, \\ 18,19,22, \\ 23 \\ 74,24 \end{gathered}$ | $\begin{gathered} \text { F6,H6,L6, } \\ \text { N6,E7,G7, } \\ \text { K7,P7 } \\ \text { D1,H1,L1, } \\ \text { N1,E2,G2, } \\ \text { K2,M2, } \\ \text { D6,P2 } \end{gathered}$ | I/O- <br> Synchronous | Bidirectional Data I/O lines. As inputs, they feed into an on-chip data register that is triggered by the rising edge of CLK. As outputs, they deliver the data contained in the memory location specified by "A" during the previous clock rise of the read cycle. The direction of the pins is controlled by $\overline{\mathrm{OE}}$. When $\overline{\mathrm{OE}}$ is asserted LOW, the pins behave as outputs. When $\mathrm{HIGH}, \mathrm{DQs}$ and $\mathrm{DQP}_{[A: B]}$ are placed in a three-state condition. |

Pin Definitions (continued)

| Name | TQFP | BGA | I/O | Description |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\mathrm{DD}}$ | $\begin{gathered} 15,41,65 \\ 91 \end{gathered}$ | $\begin{gathered} \hline \mathrm{J} 2, \mathrm{C} 4, \mathrm{~J} 4, \\ \mathrm{R} 4, \mathrm{~J} 6 \end{gathered}$ | Power Supply | Power supply inputs to the core of the device. |
| $\mathrm{V}_{\text {SS }}$ | $\begin{gathered} \text { 5,10,17, } \\ 21,26,40, \\ 55,60,67, \\ 71,76,90 \end{gathered}$ | $\begin{aligned} & \text { D3,E3,F3, } \\ & \text { H3,K3,L3, } \\ & \text { M3,N3,P3, } \\ & \text { D5,E5,F5, } \\ & \text { G5,H5,K5, } \\ & \text { M5,N5,P5 } \end{aligned}$ | Ground | Ground for the device. |

Not internally connected to the die |

## Functional Overview

All synchronous inputs pass through input registers controlled by the rising edge of the clock. All data outputs pass through output registers controlled by the rising edge of the clock.
The CY7C1327F supports secondary cache in systems utilizing either a linear or interleaved burst sequence. The interleaved burst order supports Pentium and i486 ${ }^{\text {TM }}$ processors. The linear burst sequence is suited for processors that utilize a linear burst sequence. The burst order is user selectable, and is determined by sampling the MODE input. Accesses can be initiated with either the Processor Address Strobe (ADSP) or the Controller Address Strobe (ADSC). Address advancement through the burst sequence is controlled by the ADV input. A two-bit on-chip wraparound burst counter captures the first address in a burst sequence and automatically increments the address for the rest of the burst access.

Byte Write operations are qualified with the Byte Write Enable (BWE) and Byte Write Select ( $\overline{B W}_{[A: B]}$ ) inputs. A Global Write Enable (GW) overrides all Byte Write inputs and writes data to all four bytes. All writes are simplified with on-chip synchronous self-timed Write circuitry.
Three synchronous Chip Selects $\left(\overline{\mathrm{CE}}_{1}, \mathrm{CE}_{2}, \overline{\mathrm{CE}}_{3}\right)$ and an asynchronous Output Enable (OE) provide for easy bank selection and output three-state control. ADSP is ignored if $\mathrm{CE}_{1}$ is HIGH.

## Single Read Accesses

This access is initiated when the following conditions are satisfied at clock rise: (1) ADSP or ADSC is asserted LOW, (2) $\overline{\mathrm{CE}}_{1}, \mathrm{CE}_{2}, \overline{\mathrm{CE}}_{3}$ are all asserted active, and (3) the Write signals ( $\overline{\mathrm{GW}}, \overline{\mathrm{BWE}})$ are all deserted HIGH. $\overline{\text { ADSP }}$ is ignored if $\overline{\mathrm{CE}}_{1}$ is HIGH. The address presented to the address inputs (A) is stored into the address advancement logic and the Address Register while being presented to the memory array. The corresponding data is allowed to propagate to the input of the Output Registers. At the rising edge of the next clock the data is allowed to propagate through the output register and onto the data bus within tco if OE is active LOW. The only exception occurs when the SRAM is emerging from a deselected state to a selected state, its outputs are always three-stated during the first cycle of the access. After the first cycle of the access, the outputs are controlled by the $\overline{\mathrm{OE}}$ signal. Consecutive single Read cycles are supported. Once the SRAM is deselected at clock rise by the chip select and either $\overline{\text { ADSP }}$ or $\overline{\text { ADSC }}$ signals, its output will three-state immediately.
Single Write Accesses Initiated by $\overline{A D S P}$
This access is initiated when both of the following conditions are satisfied at clock rise: (1) ADSP is asserted LOW, and (2) $\mathrm{CE}_{1}, \mathrm{CE}_{2}, \mathrm{CE}_{3}$ are all asserted active. The address presented to $A$ is loaded into the address register and the address advancement logic while being delivered to the $\underline{\text { memory array. The Write signals (GW, } \overline{\mathrm{BWE}}, \text { and } \mathrm{BW}_{[\mathrm{A}: \mathrm{B}]} \text { ) and }}$ ADV inputs are ignored during this first cycle.
$\overline{\text { ADSP-triggered Write accesses require two clock cycles to }}$ complete. If GW is asserted LOW on the second clock rise, the
data presented to the DQ inputs is written into the corresponding address location in the memory array. If $\overline{\mathrm{GW}}$ is HIGH , then the Write operation is controlled by BWE and $\overline{B W}_{[\mathrm{A}: \mathrm{B}]}$ signals. The CY7C1327F provides Byte Write capability that is described in the Write Cycle Descriptions table. Asserting the Byte Write Enable input (BWE) with the selected Byte Write $\left(\overline{B W}_{[A: B]}\right)$ input, will selectively write to only the desired bytes. Bytes not selected during a Byte Write operation will remain unaltered. A synchronous self-timed Write mechanism has been provided to simplify the Write operations.
Because the CY7C1327F is a common I/O device, the Output Enable (OE) must be deserted HIGH before presenting data to the DQ inputs. Doing so will three-state the output drivers. As a safety precaution, DQs are automatically three-stated whenever a Write cycle is detected, regardless of the state of $\overline{O E}$.

## Single Write Accesses Initiated by $\overline{A D S C}$

$\overline{\text { ADSC }}$ Write accesses are initiated when the following conditions are satisfied: (1) $\overline{\text { ADSC }}$ is asserted LOW, (2) $\overline{\text { ADSP }}$ is deserted HIGH, (3) $\mathrm{CE}_{1}, \mathrm{CE}_{2}, \mathrm{CE}_{3}$ are all asserted active, and (4) the appropriate combination of the Write inputs (GW, $\overline{\mathrm{BWE}}$, and $\left.\mathrm{BW}_{[\mathrm{A}: \mathrm{B}]}\right)$ are asserted active to conduct a Write to the desired byte(s). ADSC-triggered Write accesses require a single clock cycle to complete. The address presented to $A$ is loaded into the address register and the address advancement logic while being delivered to the memory array. The $\overline{\text { ADV }}$ input is ignored during this cycle. If a global Write is conducted, the data presented to DQ is written into the corresponding address location in the memory core. If a Byte Write is conducted, only the selected bytes are written. Bytes not selected during a Byte Write operation will remain unaltered. A synchronous self-timed Write mechanism has been provided to simplify the Write operations.
Because the CY7C1327F is a common I/O device, the Output Enable ( $\overline{\mathrm{OE}}$ ) must be deserted HIGH before presenting data to the DQ inputs. Doing so will three-state the output drivers. As a safety precaution, DQs are automatically three-stated whenever a Write cycle is detected, regardless of the state of OE.

## Burst Sequences

The CY7C1327F provides a two-bit wraparound counter, fed by A1, A0, that implements either an interleaved or linear burst
sequence. The interleaved burst sequence is designed specifically to support Intel Pentium applications. The linear burst sequence is designed to support processors that follow a linear burst sequence. The burst sequence is user selectable through the MODE input.
Asserting $\overline{\text { ADV }}$ LOW at clock rise will automatically increment the burst counter to the next address in the burst sequence. Both Read and Write burst operations are supported.

## Sleep Mode

The $Z Z$ input pin is an asynchronous input. Asserting ZZ places the SRAM in a power conservation "sleep" mode. Two clock cycles are required to enter into or exit from this "sleep" mode. While in this mode, data integrity is guaranteed. Accesses pending when entering the "sleep" mode are not considered valid nor is the completion of the operation guaranteed. The device must be deselected prior to entering the "sleep" mode. $\overline{\mathrm{CE}}_{1}, \mathrm{CE}_{2}, \overline{\mathrm{CE}}_{3}, \overline{\mathrm{ADSP}}$, and $\overline{\mathrm{ADSC}}$ must remain inactive for the duration of $t_{\text {ZZREC }}$ after the $Z Z$ input returns LOW.

| Write All Bytes | L | X | X | X |

## Notes:

2. $\mathrm{X}=$ "Don't Care." H = Logic HIGH, L = Logic LOW.
3. $\overline{\text { WRITE }}=L$ when any one or more Byte Write enable signals $\left(\overline{B W}_{A}, \overline{\mathrm{BW}}_{\mathrm{B}}\right)$ and $\overline{\mathrm{BWE}}=\mathrm{L}$ or $\overline{\mathrm{GW}}=\mathrm{L} . \overline{\mathrm{WRITE}}=\mathrm{H}$ when all Byte write enable signals $\left(\overline{\mathrm{BW}}_{\mathrm{A}}, \overline{\mathrm{BW}}_{\mathrm{B}}\right)$, BWE, GW = H
4. The $D Q$ pins are controlled by the current cycle and the $\overline{O E}$ signal. $\overline{O E}$ is asynchronous and is not sampled with the clock.
5. The SRAM always initiates a read cycle when ADSP is asserted, regardless of the state of GW, BWE, or BW ${ }_{\text {IA }}$ : B] Writes may occur only on subsequent clocks after the $\overline{\mathrm{ADSP}}$ or with the assertion of $\overline{\mathrm{ADSC}}$. As a result, $\overline{\mathrm{OE}}$ must be driven HIGH prior to the start of the write cycle to allow the outputs to three-state. $\overline{\mathrm{OE}}$ is a don't care for the remainder of the write cycle.
6. $\overline{\mathrm{OE}}$ is asynchronous and is not sampled with the clock rise. It is masked internally during write cycles. During a read cycle all data bits are three-state when $\overline{\mathrm{OE}}$ is inactive or when the device is deselected, and all data bits behave as output when OE is active (LOW).

## Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)
Storage Temperature $\qquad$ $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
Ambient Temperature with
Power Applied $\qquad$ .$-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
Supply Voltage on $\mathrm{V}_{\mathrm{DD}}$ Relative to GND........ -0.5 V to +4.6 V
DC Voltage Applied to Outputs in three-state $\qquad$ -0.5 V to $\mathrm{V}_{\mathrm{DDQ}}+0.5 \mathrm{~V}$
DC Input Voltage -0.5 V to $\mathrm{V}_{\mathrm{DD}}+0.5 \mathrm{~V}$

Current into Outputs (LOW)........................................ 20 mA
Static Discharge Voltage.......................................... > 2001V (per MIL-STD-883, Method 3015)
Latch-up Current................................................... > 200 mA

## Operating Range

| Range | Ambient <br> Temperature | $\mathbf{V}_{\mathrm{DD}}$ | $\mathbf{V}_{\mathbf{D D Q}}$ |
| :--- | :---: | :---: | :---: |

Shaded areas contain advance information.

## Notes:

10. This part has a voltage regulator internally; $t_{P O W E R}$ is the time that the power needs to be supplied above $V_{D D}$ (minimum) initially before a read or write operation can be initiated
11. $\mathrm{t}_{\mathrm{CHZ}}, \mathrm{t}_{\mathrm{CLZ}}, \mathrm{t}_{\mathrm{OELZ}}$, and $\mathrm{t}_{\mathrm{OEHZ}}$ are specified with AC test conditions shown in part (b) of AC Test Loads. Transition is measured $\pm 200 \mathrm{mV}$ from steady-state voltage.
12. At any given voltage and temperature, $\mathrm{t}_{\mathrm{OEHZ}}$ is less than $\mathrm{t}_{\mathrm{OELZ}}$ and $\mathrm{t}_{\mathrm{CHz}}$ is less than $\mathrm{t}_{\mathrm{CLZ}}$ to eliminate bus contention between SRAMs when sharing the same data bus. These specifications do not imply a bus contention condition, but reflect parameters guaranteed over worst case user conditions. Device is designed to achieve High-Z prior to Low-Z under the same system conditions.
13. This parameter is sampled and not $100 \%$ tested.
14. Timing references level is 1.5 V when $\mathrm{V}_{\mathrm{DDQ}}=3.3 \mathrm{~V}$ and is 1.25 V when $\mathrm{V}_{\mathrm{DDQ}}=2.5 \mathrm{~V}$ on all data sheets.
15. Test conditions shown in (a) of AC Test Loads unless otherwise noted.

## Switching Waveforms

## Read Cycle Timing ${ }^{[16]}$

Notes:
16. On this diagram, when $\overline{\mathrm{CE}}$ is LOW: $\overline{\mathrm{CE}}_{1}$ is LOW, $\mathrm{CE}_{2}$ is HIGH and $\overline{\mathrm{CE}}_{3}$ is LOW. When $\overline{\mathrm{CE}}$ is $\mathrm{HIGH}: \overline{\mathrm{CE}}_{1}$ is HIGH or $\mathrm{CE}_{2}$ is LOW or $\overline{\mathrm{CE}}_{3}$ is HIGH . 17. Full width write can be initiated by either $\overline{\mathrm{GW}} \mathrm{LOW}$; or by $\overline{\mathrm{GW}}$ HIGH, BWE LOW and $\overline{\mathrm{BW}}_{[\mathrm{A}: \mathrm{B}]} \mathrm{LOW}$.

Switching Waveforms (continued) Write Cycle Timing ${ }^{[16,17]}$

Switching Waveforms (continued)

## Read/Write Cycle Timing[16, 18, 19]

## Notes:

18. The data bus $(Q)$ remains in high- $Z$ following a WRITE cycle, unless a new read access is initiated by $\overline{\text { ADSP }}$ or $\overline{\text { ADSC }}$. 19. $\overline{\mathrm{GW}}$ is HIGH.
