

Single-chip Type with built-in FET Switching Regulator Series

Flexible Step-down Switching Regulators with Built-in Power MOSFET

BD9006F, BD9006HFP, BD9007F, BD9007HFP

No.09027EAT35

●Overview

The high-accuracy frequency flexible step-down switching regulator is a switching regulator with built-in POWER MOS FET, which withstands high pressure. The operational frequency is freely configurable with external resistance. It features a wide input voltage range (7V~35V) and a high frequency accuracy of $\pm 5\%$ (BD9006F, BD9006HFP; $f=200\sim 500\text{kHz}$), Furthermore, an external synchronization input pin enables synchronous operation with external clock.

●Features

- 1) Minimal external components
- 2) Wide input voltage range: 7V~35V
- 3) Frequency voltage accuracy: $\pm 5\%$ (BD9006F, BD9006HFP ; $f=200\sim 500\text{kHz}$)
 $\pm 20\%$ (BD9007F, BD9007HFP)
- 4) Built-in P-ch POWER MOS FET
- 5) Output voltage setting enabled with external resistor: $0.8\text{V}\sim V_{\text{IN}}$
- 6) Reference voltage accuracy: $0.8\text{V}\pm 2\%$
- 7) Wide operating temperature range: $-40^{\circ}\text{C}\sim +105^{\circ}\text{C}$
- 8) Low dropout: 100% ON duty cycle
- 9) Standby mode supply current: $0\mu\text{A}$ (Typ.)
- 10) Oscillation frequency variable with external resistor: $50\sim 500\text{kHz}$
- 11) External synchronization enabled
- 12) Soft start function: soft start time fixed to 5ms (Typ.)
- 13) Built-in overcurrent protection circuit
- 14) Built-in thermal shutdown protection circuit
- 15) High-power HRP7 package mounted (BD9006HFP, BD9007HFP)
- 16) Compact SOP8 package mounted (BD9006F, BD9007F)

●Applications

All fields of industrial equipment, such as Flat TV, printer, DVD, car audio, car navigation, and communication such as ETC, AV, and OA.

●Product lineup

Item	BD9006F, BD9006HFP	BD9007F, BD9007HFP
Output Current	2A	2A
Input Range	7V~35V	7V~35V
Oscillation Frequency Range	50~500kHz	50~500kHz
Oscillation Frequency Accuracy	$\pm 5\%$	$\pm 20\%$
External Synchronous Function	Provided	Provided
Standby Function	Provided	Provided
Operating Temperature	$-40^{\circ}\text{C}\sim +105^{\circ}\text{C}$	$-40^{\circ}\text{C}\sim +105^{\circ}\text{C}$
Package	SOP8/HRP7	SOP8/HRP7

●Absolute Maximum Ratings (Ta=25°C)

Parameter		Symbol	Limits	Unit
Power Supply Voltage		V _{IN}	36	V
Output Switch Pin Voltage		V _{SW}	V _{IN}	V
Output Switch Current		I _{SW}	2 ^{*1}	A
EN/SYNC Pin Voltage		V _{EN/SYNC}	V _{IN}	V
RT, FB, INV Pin Voltage		V _{RT} , V _{FB} , V _{INV}	7	
Power Dissipation	HRP7	P _d	5.5 ^{*2}	W
	SOP8		0.69 ^{*3}	W
Operating Temperature Range		T _{opr}	-40~+105	°C
Storage Temperature Range		T _{stg}	-55~+150	°C
Maximum Junction Temperature		T _{jmax}	150	°C

*1 Should not exceed P_d-value.

*2 Reduce by 44mW/°C over 25°C, when mounted on 2-layer PCB of 70×70×1.6mm³
(PCB incorporates thermal via. Copper foil area on the reverse side of PCB: 10.5×10.5mm²
Copper foil area on the reverse side of PCB: 70×70mm²)

*3 Reduce by 5.52mW/°C over 25°C, when mounted on 2-layer PCB of 70×70×1.6mm³

●Recommended Operating Range

Parameter	BD9006F, BD9006HFP	BD9007F, BD9007HFP	Unit
Operating Power Supply Voltage	7~35	7~35	V
Output Switch Current	~2	~2	A
Output Voltage (min pulse width)	250	250	ns
Oscillation Frequency	50~500	50~500	kHz
Oscillation Frequency set Resistance	27~360	27~360	kΩ

●Description of operations

• ERROR AMP

The ERROR AMP block is an error amplifier used to input the reference voltage (0.8V Typ.) and the INV pin voltage. The output FB pin controls the switching duty and output voltage V_o . These INV and FB pins are externally mounted to facilitate phase compensation. Inserting a capacitor and resistor between these pins enables adjustment of phase margin. (Refer to recommended examples on pages 11~13.)

• SOFT START

The SOFT START block provides a function to prevent the overshoot of the output voltage V_o through gradually increasing the normal rotation input of the error amplifier when power supply turns ON to gradually increase the switching Duty. The soft start time is set to 5msec (Typ.).

• SYNC

By making the "EN/SYNC" terminal less than 0.8V, the circuit can be shut down.

Furthermore, by applying pulse with higher frequency than the configured oscillation frequency to the "EN/SYNC" terminal, external sync is possible. (Sync possible with double the configured frequency-configured frequency or 500kHz)

• OSC(Oscillator)

This circuit generates the pulse wave to be input to the slope, and by connecting resistance to "RT", 50~500kHz oscillating frequency can be configured. (Refer to p.11 Fig.24)

• slope

This block generates saw tooth waves from the clock generated by the OSC. The generated saw tooth waves are sent to PWM COMPARATOR.

• PWM COMPARATOR

The PWM COMPARATOR block is a comparator to make comparison between the FB pin and internal saw tooth wave and output a switching pulse

The switching pulse duty varies with the FB value. (min Duty width : 250ns.)

• TSD (Thermal Shut Down)

In order to prevent thermal destruction/thermal runaway of the IC, the TSD block will turn OFF the output when the chip temperature reaches approximately 150°C or more. When the chip temperature falls to a specified level, the output will be reset. However, since the TSD is designed to protect the IC, the chip junction temperature should be provided with the thermal shutdown detection temperature of less than approximately 150°C.

• CURRENT LIMIT

While the output POWER P-ch MOS FET is ON, if the voltage between drain and source (ON resistance×load current) exceeds the reference voltage internally set with the IC, this block will turn OFF the output to latch. The overcurrent protection detection values have been set as shown below:

BD9006F, BD9006HFP, BD9007F, BD9007HFP · · · 4A (Typ.)

Furthermore, since this overcurrent protection is an automatically reset, after the output is turned OFF and latched, the latch will be reset with the RESET signal output by each oscillation frequency.

However, this protection circuit is only effective in preventing destruction from sudden accident. It does not support for the continuous operation of the protection circuit (e.g. if a load, which significantly exceeds the output current capacitance, is normally connected). Furthermore, since the overcurrent protection detection value has negative temperature characteristics, consider thermal design.

●Timing Chart

- (All series)
- Basic Operation

Fig.21

●External synchronizing function

In order to activate the external synchronizing function, connect the frequency setting resistor to the RT pin and then input a synchronizing signal to the EN/SYNC pin. As the synchronizing signal, input a pulse wave higher than a frequency determined with the setting resistor (RT).

However, the external sync frequency should be configured at less than double the configured frequency.

(ex.) When the configured frequency is 100kHz, the external sync frequency should be less than 200kHz.

Furthermore, the pulse wave's LOW voltage should be under 0.8V and the HIGH voltage over 2.6V (when the HIGH voltage is over 6V the EN/SYNC input current increases [see p.4 Fig.8]), the through rate of stand-up (and stand-down) under 20V/μS.

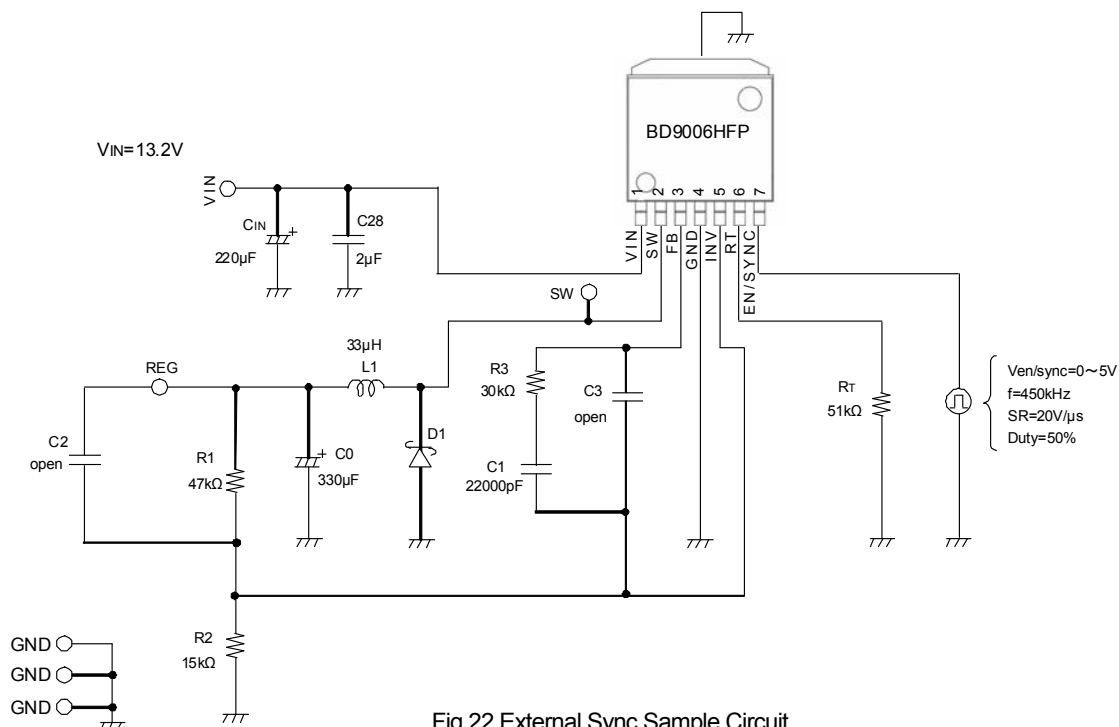

Fig.22 External Sync Sample Circuit
(Vo=3.3V, Io=1A, f=300kHz, EN/SYNC=450kHz)

●Description of external components

Fig.23

Design Procedure	Sample Calculations
<p>Vo=Output voltage, VIN (Max.)=Maximum input voltage Io (Max.)=Maximum load current, f=Oscillation frequency</p>	<p>When Vo=3.3V, VIN (Typ.)=13.2V Io(Max.)=1A and f=300kHz</p>
<p>1. Setting or output voltage Output voltage can be obtained by the formula shown below:</p> $Vo=0.8 \times (1+R1/R2)$ <p>Use the formula to select the R1 and R2. Furthermore, set the R2 to 30kΩ or less. Select the current passing through the R1 and R2 to be small enough for the output current.</p>	<p>When Vo=3.3V and R2=15kΩ</p> $3.3=0.8 \times (1+R1/15k\Omega)$ $R1=46.875k\Omega \doteq 47k\Omega$ <p style="text-align: right;"><u>R1=47kΩ</u></p>
<p>2. Selection of coil (L1) The value of the coil can be obtained by the formula shown below:</p> $L1=(VIN-Vo) \times Vo / (VIN \times f \times \Delta Io)$ <p>ΔIo: Output ripple current ΔIo should typically be approximately 20 to 30% of Io.</p> <p>If this coil is not set to the optimum value, normal (continuous) Oscillation may not be achieved. Furthermore, set the value of the coil with an adequate margin so that the peak current passing through the coil will not exceed the rated current of the coil.</p>	<p>When VIN=13.2V, Vo=3.3V, Io=1A and f=300kHz, $L1=(13.2-3.3) \times 3.3 / \{13.2 \times 300k \times (1 \times 0.3)\}$ $=27.5\mu H \doteq 33\mu H$ <p style="text-align: right;"><u>L1=33μH</u></p> </p>
<p>3. Selection of output capacitor (Co) The output capacitor can be determined according to the output ripple voltage ΔVo(p-p) required. Obtain the required ESR value by the formula shown below and then select the capacitance.</p> $\Delta IL=(VIN-Vo) \times Vo / (L \times f \times VIN)$ $\Delta Vpp=\Delta IL \times ESR + (\Delta IL \times Vo) / (2 \times Co \times f \times VIN)$ <p>Set the rating of the capacitor with an adequate margin to the output voltage. Also, set the maximum allowable ripple current with an adequate margin to ΔIL. Furthermore, the output rise time should be shorter than the soft start time. Select the output capacitor having a value smaller than that obtained by the formula shown below.</p> $C_{MAX} = \frac{3.0m \times (I_{LIMIT} - I_o(Max))}{V_o}$ <p>ILIMIT : 2A (BD9006F, BD9006HFP, BD9007F, BD9007HFP) If this capacitances is not optimum, faulty startup may result.</p> <p>(※3.0m is soft start time(min).)</p>	<p>VIN=13.2V, Vo=3.3V, L=33μH, f=300kHz $\Delta IL=(13.2-3.3) \times 3.3 / (33 \times 10^{-6} \times 300 \times 10^3 \times 13.2)$ $=0.25$ <p style="text-align: right;"><u>ΔIL=0.25A</u></p> <p>When ILIMIT: 2A, Io(Max)=1A, Vo=3.3V</p> $C_{MAX} = 3.0m \times (2-1) / 3.3$ $\doteq 910\mu$ <p style="text-align: right;"><u>CMAX=910μF</u></p> </p>

Design Method	Sample Calculations
<p>4. Selection of diode (D1) Set diode rating with an adequate margin to the maximum load current. Also, make setting of the rated inverse voltage with an adequate margin to the maximum input voltage.</p> <p>A diode with a low forward voltage and short reverse recovery time will provide high efficiency.</p>	<p>When $V_{IN(max.)}=35V$ $I_o=(max.)2A$</p> <p>Diode ratings must include: Current over 2A Withstand minimum 35V</p>
<p>5. Selection of input capacitor (C_{IN}, C28) Two capacitors, ceramic capacitor C_{IN} and bypass capacitor C28 should be inserted between the V_{IN} and GND. Be sure to insert a ceramic capacitor of 2 to 10μF for the C_{IN}. The capacitor C28 should have a low ESR and a significantly large ripple current. The ripple current I_{RMS} can be obtained by the following formula:</p> $I_{RMS}=I_o \times \sqrt{V_o \times (V_{IN}-V_o) / V_{IN}^2}$ <p>Select capacitors that can accept this ripple current. If the capacitance of C_{IN} and C28 is not optimum, the IC may malfunction.</p>	<p>When $V_{IN}=13.2V$, $V_o=3.3V$ and $I_o=1A$:</p> $I_{RMS}=1 \times \sqrt{3.3 \times (13.2-3.3) / (13.2)^2}$ <p style="text-align: right;"><u>$I_{RMS}=0.433A$</u></p>
<p>6. Setting of oscillating frequency Referring Fig.24 on the following page, select R for the oscillating frequency to be used.</p>	<p>When $f=300kHz$ From p.11 Fig.24, a resistance of $R_T=51k\Omega$ is selected. <u>$R_T=51k\Omega$</u></p>
<p>7. Setting of phase compensation (R3 and C1) The phase margin can be set through inserting a capacitor or a capacitor and resistor between the INV pin and the FB pin. Each set value varies with the output coil, capacitance, I/O voltage, and load. Therefore, set the phase compensation to the optimum value according to these conditions. (For details, refer to Application circuit on page.11~) If this setting is not optimum, output oscillation may result.</p>	<p>※Please contact us if there are any questions regarding phase compensation configuration.</p>

※ The set values listed above are all reference values. On the actual mounting of the IC, the characteristics may vary with the routing of wirings and the types of parts in use. In the connection, it is recommended to thoroughly verify these values on the actual system prior to use.

●Directions for pattern layout of PCB

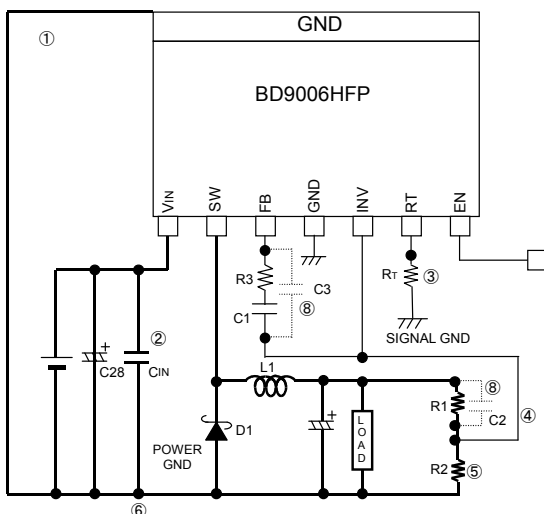

Fig.24

- ① Arrange the wirings shown by heavy lines as short as possible in a broad pattern.
- ② Locate the input ceramic capacitor C_{IN} as close to the V_{IN}-GND pin as possible.
- ③ Locate the R_T as close to the GND pin as possible.
- ④ Locate the R1 and R2 as close to the INV pin as possible, and provide the shortest wiring from the R1 and R2 to the INV pin.
- ⑤ Locate the R1 and R2 as far away from the L1 as possible.
- ⑥ Separate POWER GND (Schottky diode, I/O capacitor's GND) and SIGNAL GND (R_T, GND), so that SW noise doesn't have an effect on SIGNAL GND at all.
- ⑦ Design the POWER wire line as wide and short as possible.
- ⑧ Additional pattern for C2 and C3 expand compensation flexibility.

Fig.25 BD9006F Reference Layout Pattern

※As shown above ,design the GND pattern as large as possible within inner layer.
 ※Grav zones indicate GND.

Fig.26 BD9006HFP Reference Layout Pattern

※ The values in the graph for oscillating frequency are Typical values, and variance of±5% forBD9006F/HFP and ±20% for BD9007F/HFP should be considered.

●Phase Compensation setting procedure

1. Application stability conditions

The following section describes the stability conditions of the negative feedback system.

Since the DC/DC converter application is sampled according to the switching frequency, GBW (frequency at 0-dB gain) of the overall system should be set to 1/10 or less of the switching frequency. The following section summarizes the targeted characteristics of this application.

- At a 1 (0-dB) gain, the phase delay is 150° or less (i.e. the phase margin is 30° or more).
- The GBW for this occasion is 1/10 or less of the switching frequency.

Responsiveness is determined with restrictions on the GBW. To improve responsiveness, higher switching frequency should be provided.

Replace a secondary phase delay (-180°) with a secondary phase lead by inserting two-phase leads, to ensure the stability through the phase compensation. Furthermore, the GBW (i.e., frequency at 0-dB gain) is determined according to phase compensation capacitance provided for the error amplifier. Consequently, in order to reduce the GBW, increase the capacitance value.

(1) Typical integrator (low pass filter)

(2) Open loop characteristics of integrator

Since the error amplifier is provided with (1) or (2) phase compensation, the low pass filter is applied. In the case of the DC/DC converter application, the R becomes a parallel resistance of the feedback resistance.

2. For output capacitors having high ESR, such as electrolyte capacitor

For output capacitors that have high ESR (i.e., several Ω), the phase compensation setting procedure becomes comparatively simple. Since the DC/DC converter application has a LC resonant circuit attached to the output, a -180° phase-delay occurs in that area. If ESR component is present, however a +90° phase-lead occurs to shift the phase delay to -90°. Since the phase delay should be set within 150°, it is a very effective method but tends to increase the ripple component of the output voltage.

(1) LC resonant circuit

$$f_r = \frac{1}{2\pi\sqrt{LC}} \text{ [Hz]}$$

At this resonance point, a -180° phase-delay occurs.

(2) With ESR provided

$$f_r = \frac{1}{2\pi\sqrt{LC}} \text{ [Hz]: Resonance}$$

$$f_{ESR} = \frac{1}{2\pi R_{ESR}C} \text{ [Hz]: Phase lead}$$

A -90° phase-delay occurs.

According to changes in phase characteristics, due to the ESR, only one phase lead should be inserted. For this phase lead, select either of the methods shows below:

(3) Insert Feedback Resistance in the C.

$$\text{Phase lead } f_z = \frac{1}{2\pi C_1 R_1} \text{ [Hz]}$$

(4) Insert the R3 in integrator.

$$\text{Phase lead } f_z = \frac{1}{2\pi C_2 R_3} \text{ [Hz]}$$

To cancel the LC resonance, the frequency to insert the phase lead should be set close to the LC resonant frequency. The setting above have is estimated. Consequently, the setting may be adjusted on the actual system. Furthermore, since these characteristics vary with the layout of PCB loading conditions, precise calculations should be made on the actual system.

3. For output capacitors having low ESR, such as low impedance electrolyte capacitor or OS-CON

In order to use capacitors with low ESR (i.e., several tens of mΩ), two phase-leads should be inserted so that a -180° phase-delay, due to LC resonance, will be compensated. The following section shows a typical phase compensation procedure.

(1) Phase compensation with secondary phase lead

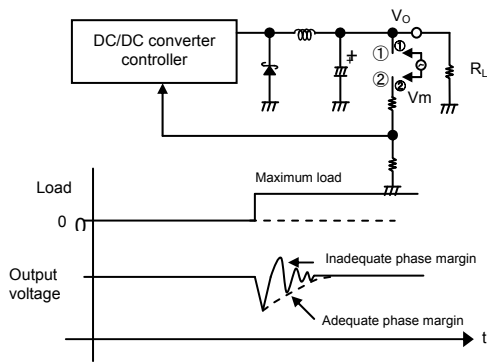

$$\text{Phase lead : } f_{z1} = \frac{1}{2\pi R_1 C_1} \text{ [Hz]}$$

$$\text{Phase lead : } f_{z2} = \frac{1}{2\pi R_3 C_2} \text{ [Hz]}$$

$$\text{LC resonant : } f_r = \frac{1}{2\pi\sqrt{LC}} \text{ [Hz]}$$

frequency

To set phase lead frequency, insert both of the phase leads close to the LC resonant frequency. According to empirical rule, setting the phase lead frequency f_{Z2} with R₃ and C₂ lower than the LC resonant frequency f_r, and the phase lead frequency f_{Z1} with the R₁ and C₁ higher than the LC resonant frequency f_r, will provide stable application conditions.

<Reference>

Measurement of open loop of the DC/DC converter
 To measure the open loop of the DC/DC converter, use the gain phase analyzer or FRA to measure the frequency characteristics.

<Procedure>

1. Check to ensure output causes no oscillation at the maximum load inclosed loop.
2. Isolate ① and ② and insert Vm (with amplitude of approximately 100mVpp).
3. Measure (probe) the oscillation of ① to that of ②.

Furthermore, the phase margin can also be measured with the load responsiveness. Measure variations in the output voltage when instantaneously changing the load from no load to the maximum load. Even though ringing phenomenon is caused, due to low phase margin, no ringing takes place. Phase margin is provided. However, no specific phase margin can be probed.

※Please contact us if you have any questions regarding phase compensation.

●Heat Loss

For thermal design, be sure to operate the IC within the following conditions.
 (Since the temperatures described hereunder are all guaranteed temperature, take margin into account.)

1. The ambient temperature Ta is to be 105°C or less.
2. The chip junction temperature Tj is to be 150°C or less.

The chip junction temperature Tj can be considered in the following two patterns:

To obtain Tj from the IC surface temperature Tc in actual use state, $T_j = T_c + \theta_j - a \times W$

< Reference value > HRP7 7°C/W
 SOP8 32.5°C/W

To obtain Tj from the ambient temperature Ta in actual use state, $T_j = T_c + \theta_j - c \times W$

< Reference. value >

- θj-a : HRP7 89.3°C/W Single piece of IC
 54.3°C/W 2-layer PCB (Copper foil area on the front side of PCB: 15×15mm²)
 22.7°C/W 2-layer PCB (Copper foil area on the front side of PCB: 70×70mm²)
 PCB size: 70×70×1.6mm³ (PCB incorporates thermal via.)
 Copper foil area on the front side of PCB: 10.5×10.5mm²
- θj-a : SOP8 222.2°C/W Single piece of IC
 181.8°C/W 1-layer PCB
 PCB size: 70×70×1.6mm³

The heat loss W of the IC can be obtained by the formula shown below:

$$W = R_{on} \times I_o^2 \times \frac{V_o}{V_{IN}} + V_{IN} \times I_{cc} + T_r \times V_{IN} \times I_o \times f$$

Ron: ON resistance of IC (refer to page.4) Io: Load current
 Vo: Output voltage VIN: Input voltage Icc: Circuit current (refer to page.3)
 Tr: Switching rise/fall time (approximately 20nsec)
 f: Oscillation frequency

① $R_{on} \times I_o^2$
 ② $2 \times \frac{1}{2} \times T_r \times \frac{1}{T} \times V_{IN} \times I_o$
 = $T_r \times V_{IN} \times I_o \times f$

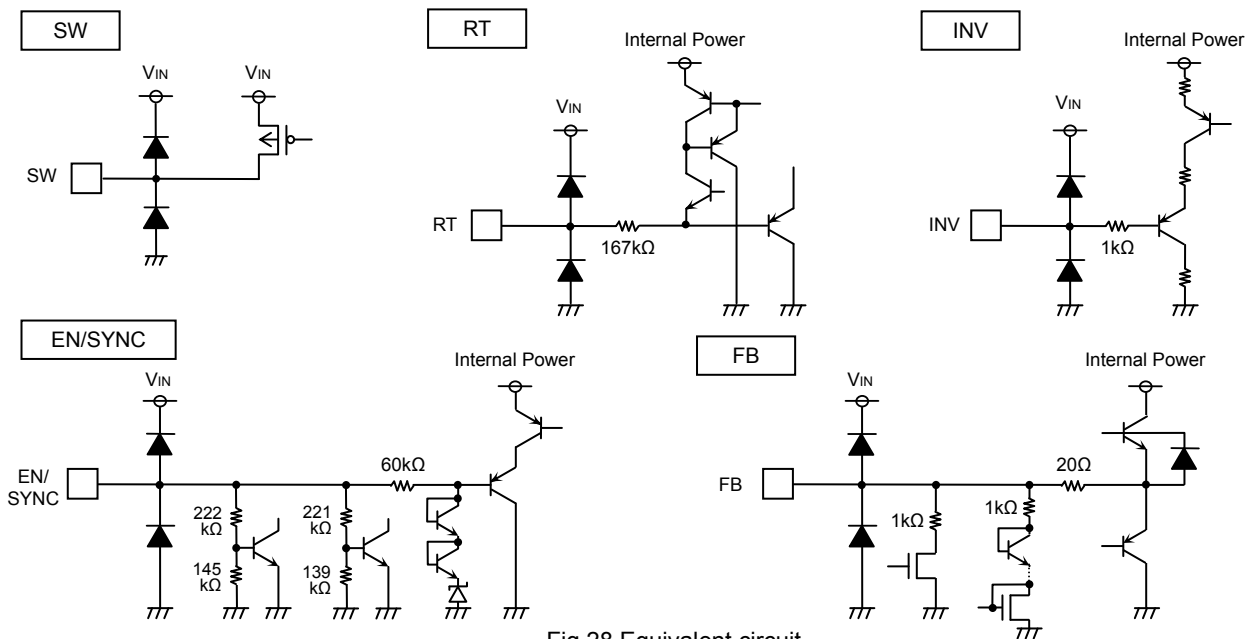

Fig.28 Equivalent circuit

●Notes for use

1. Absolute maximum ratings
If excess in the absolute maximum ratings, such as supply voltage, temperature range of operating conditions, etc., can break down the devices, thus making impossible to identify breaking mode, such as a short circuit or an open circuit. If any over rated values will expect to exceed the absolute maximum ratings, consider adding circuit protection devices, such as fuses.
2. GND potential
Ground-GND potential should maintain at the minimum ground voltage level. Furthermore, no terminals should be lower than the GND potential voltage including electric transients.
3. Thermal design
Use a thermal design that allows for a sufficient margin in light of the power dissipation (Pd) in actual operating conditions.
4. Inter-pin shorts and mounting errors
When attaching to the set substrate, pay special attention to the direction and proper placement of the IC. If the IC is attached incorrectly, it may be destroyed.
Furthermore, when using the IC with VIN and EN/SYNC terminals shorted, and the 5-pin (SOP8 package) or 7-pin (HRP7 package) EN/SYNC terminal and 6-pin RT terminal are shorted, the IC may also be damaged when VIN>7V.
5. Operation in strong electromagnetic field
Use caution when using the IC in the presence of a strong electromagnetic field as doing so may cause the IC to malfunction.
6. Inspection with set printed circuit board
When testing the IC on an application board, connecting a capacitor to a pin with low impedance subjects the IC to stress. Always discharge capacitors after each process or step. Always turn the IC's power supply off before connecting it to, or removing it from a jig or fixture, during the inspection process. Ground the IC during assembly steps as an antistatic measure. Use similar precaution when transporting and storing the IC.
7. IC pin input (Fig. 26)

This monolithic IC contains P+ isolation and P substrate layers between adjacent elements to keep them isolated. P-N junctions are formed at the intersection of these P layers with the N layers of other elements, creating a parasitic, creating a parasitic diode or transistor. For example, the relation between each potential is as follows:

- When GND>pin A and GND>pin B, the P-N junction operates as a parasitic diode.
- When pin B >GND>pin A, the P-N junction operates as a parasitic transistor. Parasitic diodes can occur inevitably in the structure of the IC. The operation of parasitic diodes can result in mutual interference among circuits, operational faults, or physical damage. Accordingly, methods by which parasitic diodes operate, such as applying a voltage that is lower than the GND (P substrate) voltage to an input pin, should not be used

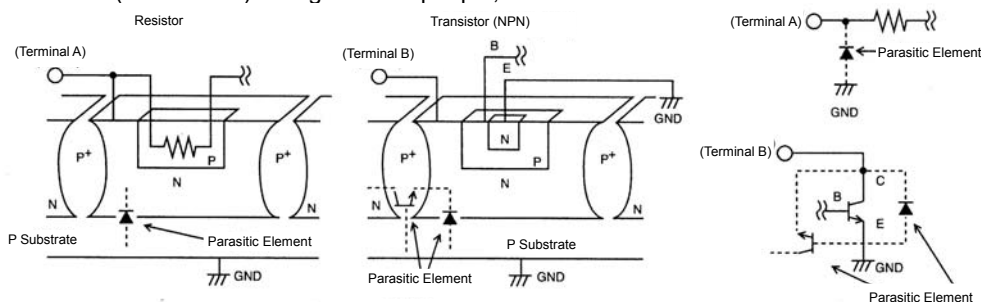

Fig.29 Typical simple construction of monolithic IC

8. GND wiring pattern

It is recommended to separate the large-current GND pattern from the small-signal GND pattern and establish a single ground at the reference point of the set PCB, so that resistance to the wiring pattern and voltage fluctuations due to a large current will cause on fluctuations in voltages of the small-signal GND. Prevent fluctuations in the GND wiring pattern of external parts.

9. Temperature protection (thermal shut down) circuit

This IC has a built-in temperature protection circuit to prevent the thermal destruction of the IC. As described above, be sure to use this IC within the power dissipation range. Should a condition exceeding the power dissipation range continue, the chip temperature T_j will rise to activate the temperature protection circuit, thus turning OFF the output power element. Then, when the tip temperature T_j falls, the circuit will be automatically reset. Furthermore, if the temperature protection circuit is activated under the condition exceeding the absolute maximum ratings, do not attempt to use the temperature protection circuit for set design.

10. On the application shown below, if there is a mode in which V_{IN} and each pin potential are inverted, for example, if the V_{IN} is short-circuited to the Ground with external diode charged, internal circuits may be damaged. To avoid damage, it is recommended to insert a backflow prevention diode in the series with V_{IN} or a bypass diode between each pin and V_{IN} .

●Ordering part number

B D

9 0 0 6

H F P -

T R

Part No.

Part No.
9006, 9007

Package

F : SOP8
HFP : HRP7

Packaging and forming specification

E2: Embossed tape and reel (SOP8)
TR: Embossed tape and reel (HRP7)

SOP8

<Tape and Reel information>

Tape	Embossed carrier tape
Quantity	2500pcs
Direction of feed	E2 (The direction is the 1pin of product is at the upper left when you hold reel on the left hand and you pull out the tape on the right hand)

HRP7

<Tape and Reel information>

Tape	Embossed carrier tape
Quantity	2000pcs
Direction of feed	TR (The direction is the 1pin of product is at the upper right when you hold reel on the left hand and you pull out the tape on the right hand)

Notes

No copying or reproduction of this document, in part or in whole, is permitted without the consent of ROHM Co.,Ltd.

The content specified herein is subject to change for improvement without notice.

The content specified herein is for the purpose of introducing ROHM's products (hereinafter "Products"). If you wish to use any such Product, please be sure to refer to the specifications, which can be obtained from ROHM upon request.

Examples of application circuits, circuit constants and any other information contained herein illustrate the standard usage and operations of the Products. The peripheral conditions must be taken into account when designing circuits for mass production.

Great care was taken in ensuring the accuracy of the information specified in this document. However, should you incur any damage arising from any inaccuracy or misprint of such information, ROHM shall bear no responsibility for such damage.

The technical information specified herein is intended only to show the typical functions of and examples of application circuits for the Products. ROHM does not grant you, explicitly or implicitly, any license to use or exercise intellectual property or other rights held by ROHM and other parties. ROHM shall bear no responsibility whatsoever for any dispute arising from the use of such technical information.

The Products specified in this document are intended to be used with general-use electronic equipment or devices (such as audio visual equipment, office-automation equipment, communication devices, electronic appliances and amusement devices).

The Products specified in this document are not designed to be radiation tolerant.

While ROHM always makes efforts to enhance the quality and reliability of its Products, a Product may fail or malfunction for a variety of reasons.

Please be sure to implement in your equipment using the Products safety measures to guard against the possibility of physical injury, fire or any other damage caused in the event of the failure of any Product, such as derating, redundancy, fire control and fail-safe designs. ROHM shall bear no responsibility whatsoever for your use of any Product outside of the prescribed scope or not in accordance with the instruction manual.

The Products are not designed or manufactured to be used with any equipment, device or system which requires an extremely high level of reliability the failure or malfunction of which may result in a direct threat to human life or create a risk of human injury (such as a medical instrument, transportation equipment, aerospace machinery, nuclear-reactor controller, fuel-controller or other safety device). ROHM shall bear no responsibility in any way for use of any of the Products for the above special purposes. If a Product is intended to be used for any such special purpose, please contact a ROHM sales representative before purchasing.

If you intend to export or ship overseas any Product or technology specified herein that may be controlled under the Foreign Exchange and the Foreign Trade Law, you will be required to obtain a license or permit under the Law.

Thank you for your accessing to ROHM product informations.
