

## ST662AB ST662AC

DC-DC converter from 5 V to 12 V, 0.03 A  
for Flash memory programming supply

### Features

- Output voltage: 12 V  $\pm$  5 %
- Supply voltage range: 4.5 V to 5.5 V
- Guaranteed output current up to 30 mA
- Very low quiescent current: 100  $\mu$ A
- Logic controlled electronic shutdown: 1  $\mu$ A
- Just capacitors needed (no inductor)

### Description

The ST662A is a regulated charge pump DC-DC converter. It provides 12 V  $\pm$  5 % output voltage to program byte-wide Flash memory, and can supply 30 mA output current from input as low as 4.75 V. A logic controlled shut down pin that interfaces directly with microprocessor reduces the supply current to only 1  $\mu$ A. The ST662AB is available as Automotive Grade in SO-8 package. This device is qualified according to the specification AEC-Q100 of the Automotive market, in the temperature range - 40 °C to 125 °C, and the statistical tests PAT, SYL, SBL are performed.

# 1 Application circuit

Figure 1. Typical application circuit

## 2 Pin configuration

Figure 2. Pin connections (top view)

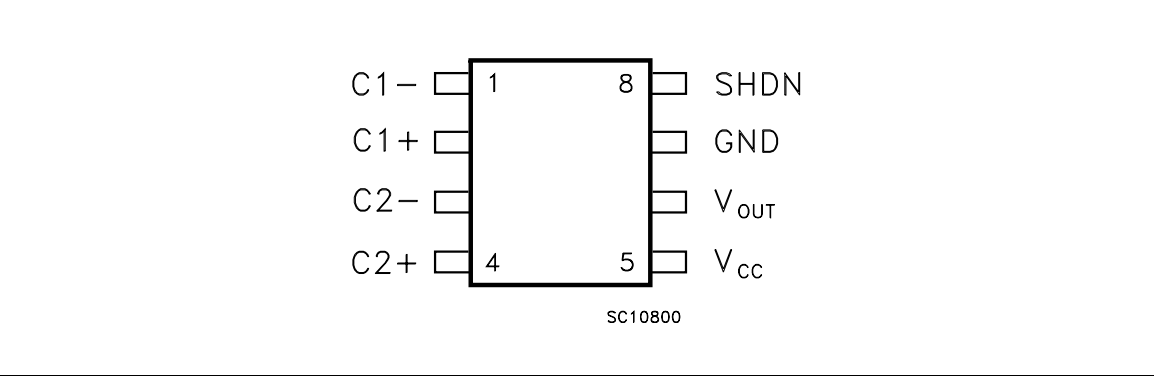

Table 2. Pin description

Pin n°	Symbol	Name and function
1	C1-	Negative terminal for the first charge pump capacitor
2	C1+	Positive terminal for the first charge pump capacitor
3	C2-	Negative terminal for the second charge pump capacitor
4	C2+	Positive terminal for the second charge pump capacitor
5	V <sub>CC</sub>	Supply voltage
6	V <sub>OUT</sub>	12 V output voltage V <sub>OUT</sub> = V <sub>CC</sub> when in shutdown mode
7	GND	Ground
8	SHDN	Active high C-MOS logic level shutdown input. SHDN is internally pulled up to V <sub>CC</sub> . Connect to GND for normal operation. In Shutdown mode the charge pumps are turned off and V <sub>OUT</sub> = V <sub>CC</sub>

### 3 Maximum ratings

**Table 3. Absolute maximum ratings**

Symbol	Parameter		Value	Unit
$V_{CC}$	DC input voltage to GND		-0.3 to 6	V
SHDN	Shutdown voltage		-0.3 to ( $V_{CC} + 0.3$ )	V
$I_O$	Output current continuous		50	A
$P_D$	Power dissipation		500	mW
$T_{OP}$	Operating ambient temperature range	AC series	0 to 70	°C
		AB series	-40 to 85	
$T_{STG}$	Storage temperature range		-40 to 150	°C

*Note: Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these condition is not implied.*

**Table 4. Thermal data**

Symbol	Parameter	SO-8	Unit
$R_{thJC}$	Thermal resistance junction-case	20	°C/W

## 4 Electrical characteristics

Refer to the test circuits,  $V_{CC} = 4.5 \text{ V}$  to  $5.5 \text{ V}$ ,  $T_A = T_{MIN}$  to  $T_{MAX}$ , unless otherwise specified. Typical value are referred at  $T_A = 25^\circ\text{C}$ .

**Table 5. Electrical characteristics**

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
$V_O$	Output voltage	$I_O = 0$ to $20 \text{ mA}$	11.4	12	12.6	V
		$I_O = 0$ to $30 \text{ mA}$ , $V_{CC} = 4.75$ to $5.5 \text{ V}$	11.4	12	12.6	
$I_{Q1}$	Quiescent current	NO LOAD, $V_{SHDN} = 0$		100	500	$\mu\text{A}$
$I_{Q2}$	Shutdown current	NO LOAD, $V_{SHDN} = V_{CC}$		1	10	$\mu\text{A}$
$I_{SH}$	Shutdown pin current	$V_{SHDN} = 0$ , $V_{CC} = 5 \text{ V}$	-50	-12	-5	$\mu\text{A}$
		$V_{SHDN} = V_{CC} = 5 \text{ V}$		0		$\mu\text{A}$
$V_{IL}$	Shutdown input low threshold				0.4	V
$V_{IH}$	Shutdown input high threshold		2.4			V
$f_O$	Oscillator frequency	$V_{CC} = 5 \text{ V}$ , $I_O = 30 \text{ mA}$		400		kHz
$n$	Power efficiency	$V_{CC} = 5 \text{ V}$ , $I_O = 30 \text{ mA}$		72		%
$R_{SW}$	$V_{CC} - V_{OUT}$ switch impedance	$V_{SHDN} = V_{CC} = 5 \text{ V}$ , $I_O = 100 \mu\text{A}$		1	2	$\text{k}\Omega$

Refer to the test circuits,  $V_{CC} = 4.5 \text{ V}$  to  $5.5 \text{ V}$ ,  $T_A = -40$  to  $125^\circ\text{C}$ , unless otherwise specified. Typical value are referred at  $T_A = 25^\circ\text{C}$ .

**Table 6. Electrical characteristics for ST662AB-TRY (Automotive Grade)**

## 6 Description

The ST662 is an IC developed to provide a 12 V regulated output 30 mA from voltage input as low as 4.75 without any inductors. It is useful for a wide range of applications and its performances make it ideal for Flash memory programming supply.

An evaluation kit is provided to facilitate the application. This include a single-side demo board designed for surface-mount components. The operating principle of ST662 (see [Figure 12](#)) is to charge C1 and C2 capacitor by closing the S1 switch (while S2 is opened) at the  $V_{CC}$  voltage. After S1 is opened and S2 closed so that C1 and C2 capacitors are placed in series one to each other, and both are in series with  $V_{IN}$ . The sum of  $V_{C1}$  and  $V_{C2}$  and  $V_I$  is applied to the capacitor C4. This works as voltage triple. An amplifier error checks the output voltage and blocks the oscillator if the output voltage is greater than 12 V. The shutdown pin is internally pulled to  $V_{CC}$ . When it is held low the output voltage rises to +12 V. [Figure 13](#) shows the transition time of the shut down pin when the  $V_{SHDN}$  goes from 5 V to 0 V. Input logic levels of this input are CMOS compatible. Applying a logic high at this input, the  $V_{OUT}$  oscillator is blocked and the  $V_{OUT}$  is reach the  $V_I$  value by D1. In this condition  $I_{CC}$  is low as 1  $\mu$ A. The [Figure 14](#) shows the transition time of the shut down pin when the  $V_{SHDN}$  goes from 0 V to 5 V.

Figure 12. Operating principle circuit

 $V_{CC} = 5\text{ V}$ ,  $I_{OUT} = 200\text{ }\mu\text{A}$ 

Figure 14. Entering shutdown

 $V_{CC} = 5\text{ V}$ ,  $I_{OUT} = 200\text{ }\mu\text{A}$

## 7 Application circuit

Based on fast charge/discharge of capacitors, this circuit involves high  $di/dt$  values limited only by  $R_{ON}$  of switches. This implies a critical layout design due to the need to minimize inductive paths and place capacitors as close as possible to the device.

A good layout design is strongly recommended for noise reason. For best performance, use very short connections to the capacitors and the values shown in [Table 7](#).

C3 and C4 must have low ESR in order to minimize the output ripple. Their values can be reduced to 2  $\mu F$  and 1  $\mu F$ , respectively, when using ceramic capacitors, but must be of 10  $\mu F$  or larger if aluminium electrolytic are chosen.

C5 must be placed as close to the device as possible and could be omitted if very low output noise performance are not required.

[Figure 15](#) and [Figure 16](#) show, respectively, our EVALUATION kit layout and the relatively.

( $I_{OUT} = 30\text{ mA}$ ) $V_{CC} = 4.5$  to 5.5V,  $I_{OUT} = 30\text{ mA}$

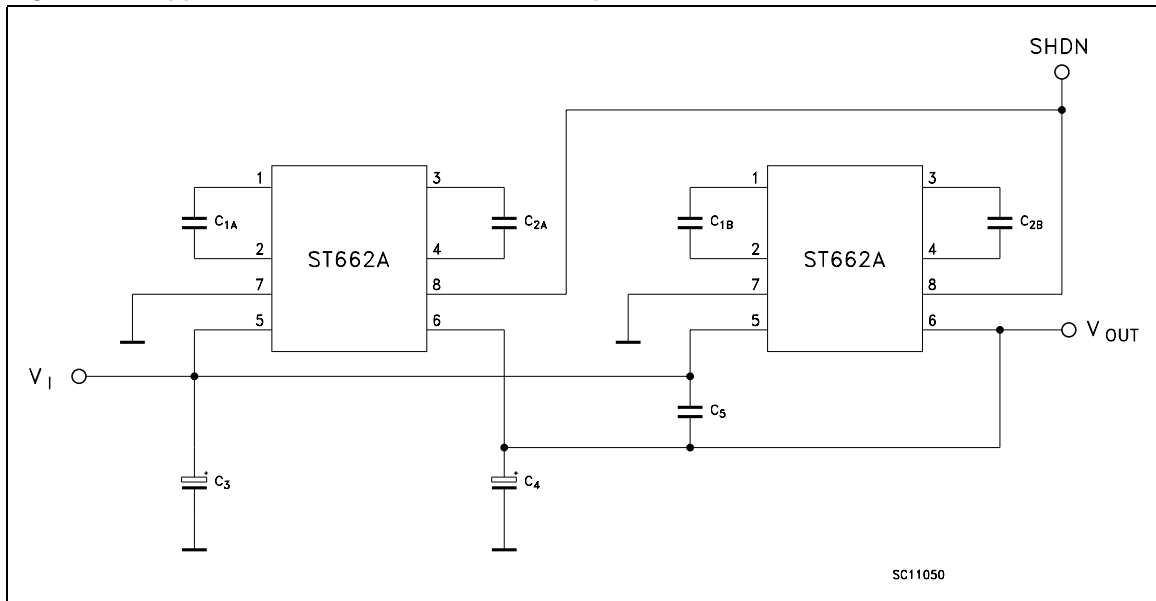

## 8 How to increase output current or output voltage capability

Current capability is limited by  $R_{ON}$  of internal switches. It is possible to increase it connecting in parallel two or more ST662A devices; each one of them can supply 30 mA. The [Figure 19](#) shows the electric schematic. The capacitors C3, C4 and C5 must be placed very close to the ICs on the board. If this is not possible, you can place two different capacitors, each of them of half value, very close to the respective integrated circuit.

[Figure 23](#) show the output current capability of the proposed circuit.

If an output voltage greater than 12 V is required, it's possible to realize the circuit of the following diagram [Figure 22](#). The relevant output current capability is shown in [Figure 24](#) in which is shown the output voltage vs. load current.
