

## 1.1MHz, 1A Switch PWM DC/DC Converter

June 2000

**NOT RECOMMENDED FOR NEW DESIGNS**  
Contact Linear Technology for Potential Replacement

### FEATURES

- 1A, 0.5Ω, 30V Internal Switch
- 1.1MHz Fixed Frequency Operation
- Operates with  $V_{IN}$  as Low as 1.5V
- Low-Battery Detector Stays Active in Shutdown
- Low  $V_{CESAT}$  Switch: 410mV at 800mA
- Pin-for-Pin Compatible with the LT1317B
- Uses Ceramic Capacitors
- Small 8-Lead MSOP Package

### APPLICATIONS

- LCD Bias Supplies
- GPS Receivers
- Battery Backup
- Portable Electronic Equipment
- Diagnostic Medical Instrumentation

### DESCRIPTION

The LT<sup>®</sup>1949-1 is a fixed frequency step-up DC/DC converter with a 1A, 0.5Ω internal switch. Capable of generating 10V at 175mA from a 3.3V input, the LT1949-1 is ideal for generating bias voltages for large screen LCD panels. Constant frequency 1.1MHz operation results in a low noise output that is easy to filter and the 30V switch rating allows output voltage up to 28V using a single inductor. The high switching frequency allows the use of ceramic output capacitors. An external compensation pin gives the user flexibility in optimizing loop compensation, allowing small, low ESR ceramic capacitors to be used at the output. The 8-lead MSOP package ensures a low profile overall solution.

The LT1949-1 includes a low-battery detector that stays alive when the device goes into shutdown. Quiescent current in shutdown is 50μA, while operating current is 8mA.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

## ABSOLUTE MAXIMUM RATINGS

(Note 1)

$V_{IN}$ , LBO Voltage .....	12V
SW Voltage .....	-0.4V to 30V
FB Voltage .....	$V_{IN} + 0.3V$
$V_C$ Voltage .....	2V
LBI Voltage .....	$0V \leq V_{LBI} \leq 1V$
SHDN Voltage .....	6V
Junction Temperature .....	125°C
Operating Temperature Range (Note 2) ...	-40°C to 85°C
Storage Temperature .....	-65°C to 150°C
Lead Temperature (Soldering, 10sec) .....	300°C

## ELECTRICAL CHARACTERISTICS

The ● denotes the specifications which apply over the full operating temperature range, otherwise specifications are at  $T_A = 25^\circ\text{C}$ .  $V_{IN} = 2V$ ,  $V_{SHDN} = 2V$  unless otherwise noted.

SYMBOL	PARAMETER	CONDITIONS	MIN	TYP	MAX	UNITS	
$I_Q$	Quiescent Current	$V_{SHDN} = 0V$	●	8	14	mA	
			●	50	80	$\mu\text{A}$	
$V_{FB}$	Feedback Voltage		●	1.22	1.24	1.26	V
			●	1.20	1.24	1.26	V
$I_B$	FB Pin Bias Current (Note 3)		●	24	150	nA	
			●	1.7	12	V	
$g_m$	Error Amp Transconductance	$\Delta I = 5\mu\text{A}$	●	140	280	480	$\mu\text{mhos}$
$A_V$	Error Amp Voltage Gain		●	700		V/V	
			●	80	85	%	
$f_{OSC}$	Switching Frequency	$V_{IN} = 2.5V$ , Duty Cycle = 30%	●	1	1.1	1.5	A
			●	0.85	1.1	1.35	MHz
	Shutdown Pin Current	$V_{SHDN} = V_{IN}$ $V_{SHDN} = 0V$	●	0.015	0.1	$\mu\text{A}$	
			●	-5	-14	$\mu\text{A}$	
	LBI Threshold Voltage		●	190	200	210	mV
			●	180	200	220	mV
	LBO Output Low	$I_{SINK} = 10\mu\text{A}$	●	0.15	0.25	V	
	LBO Leakage Current	$V_{LBI} = 250\text{mV}$ , $V_{LBO} = 5V$	●	20	100	nA	
	LBI Input Bias Current (Note 5)	$V_{LBI} = 150\text{mV}$	●	30	120	nA	
	Low-Battery Detector Gain	1M $\Omega$ Pull-Up		2000		V/V	
	Switch Leakage Current	$V_{SW} = 5V$	●	0.01	3	$\mu\text{A}$	
	Switch $V_{CESAT}$	$I_{SW} = 800\text{mA}$ $I_{SW} = 500\text{mA}$	●	410		mV	
			●	270	400	mV	
	Reference Line Regulation	$1.8V \leq V_{IN} \leq 12V$		0.08		%/V	
	SHDN Input Voltage High		●	1.4	6	V	
	SHDN Input Voltage Low		●		0.4	V	

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

**Note 2:** The LT1949-1E is guaranteed to meet performance specifications from 0°C to 70°C. Specifications over the -40°C to 85°C operating temperature range are assured by design, characterization and correlation with statistical process controls.

**Note 3:** Bias current flows into FB pin.

**Note 4:** Switch current limit guaranteed by design and/or correlation to static tests. Duty cycle affects current limit due to ramp generator.

**Note 5:** Bias current flows out of LBI pin.

## TYPICAL PERFORMANCE CHARACTERISTICS

## PIN FUNCTIONS

**V<sub>C</sub> (Pin 1):** Compensation Pin for Error Amplifier. Connect a series RC network from this pin to ground. Typical values for compensation are a 30k/330pF combination when using ceramic output capacitors. Minimize trace area at V<sub>C</sub>.

**FB (Pin 2):** Feedback Pin. Reference voltage is 1.24V. Connect resistor divider tap here. Minimize trace area at FB. Set V<sub>OUT</sub> according to:  $V_{OUT} = 1.24V(1 + R1/R2)$ .

**SHDN (Pin 3):** Shutdown. Pull this pin low for shutdown mode (only the low-battery detector remains active). Leave this pin floating or tie to a voltage between 1.4V and 6V to enable the device. SHDN pin is logic level and need only meet the logic specification (1.4V for high, 0.4V for low).

**GND (Pin 4):** Ground. Connect directly to local ground plane.

**SW (Pin 5):** Switch Pin. Connect inductor/diode here. Minimize trace area at this pin to keep EMI down.

**V<sub>IN</sub> (Pin 6):** Supply Pin. Must be bypassed close to the pin.

**LBI (Pin 7):** Low-Battery Detector Input. 200mV reference. Voltage on LBI must stay between ground and 700mV. Low-battery detector remains active in shutdown mode.

**LBO (Pin 8):** Low-Battery Detector Output. Open collector, can sink 10µA. A 1MΩ pull-up is recommended.

## BLOCK DIAGRAM

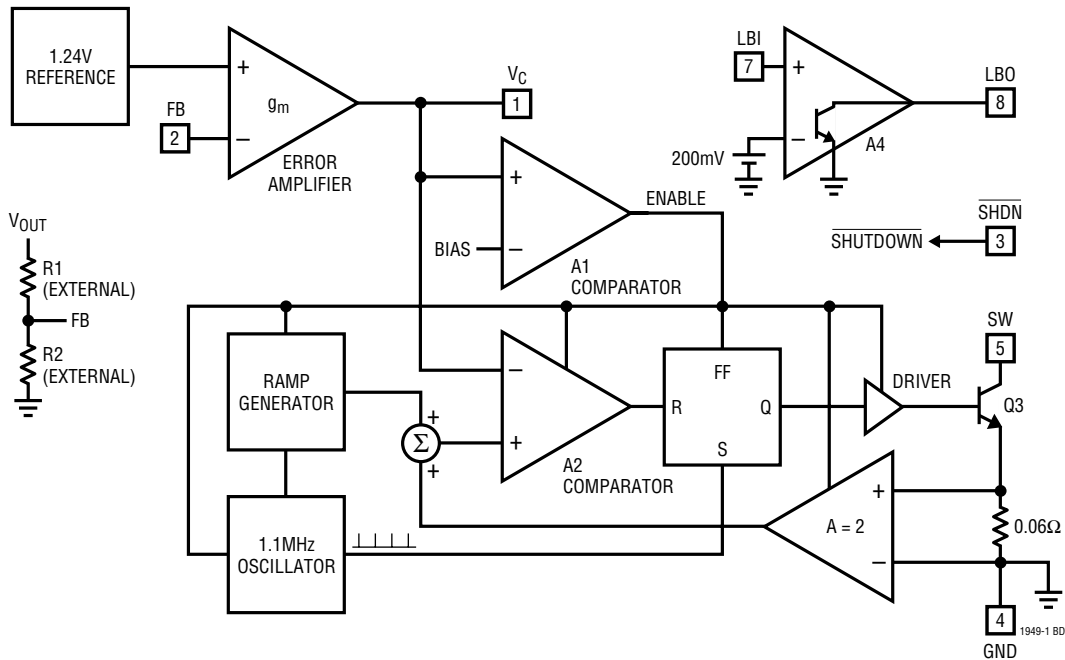

Figure 3. LT1949-1 Block Diagram

## OPERATION

The LT1949-1 is a current mode, fixed frequency step-up DC/DC converter with an internal 1A NPN power transistor. Operation can best be understood by referring to the Block Diagram.

At the beginning of each oscillator cycle, the flip-flop is set and the switch is turned on. Current in the switch ramps up until the voltage at A2's positive input reaches the  $V_C$  pin voltage, causing A2's output to change state and the switch to be turned off. The signal at A2's positive input is a summation of a signal representing switch current and a ramp generator (introduced to avoid subharmonic oscillations at duty factors greater than 50%). If the load increases,  $V_{OUT}$  (and FB) will drop slightly and the error amplifier will drive  $V_C$  to a higher voltage, causing current in the switch to increase. In this way, the error amplifier drives the  $V_C$  pin to the voltage necessary to satisfy the load. Frequency compensation is provided by an external series RC network connected between the  $V_C$  pin and ground.

## Layout Hints

The LT1949-1 switches current at high speed, mandating careful attention to layout for proper performance. *You will not get advertised performance with careless layouts.* Figure 4 shows recommended component placement for a boost (step-up) converter. Follow this closely in your PC layout. Note the direct path of the switching loops. Input capacitor  $C_1$  *must* be placed close (<5mm) to the IC package. As little as 10mm of wire or PC trace from  $C_{IN}$  to  $V_{IN}$  will cause problems such as inability to regulate or oscillation.

The ground terminal of output capacitor  $C_2$  should tie close to Pin 4 of the LT1949-1. Doing this reduces  $dI/dt$  in the ground copper which keeps high frequency spikes to a minimum. The DC/DC converter ground should tie to the PC board ground plane at one place only, to avoid introducing  $dI/dt$  in the ground plane.

## OPERATION

**Figure 4. Recommended Component Placement for Boost Converter. Note Direct High Current Paths Using Wide PC Traces. Minimize Trace Area at Pin 1 (V<sub>C</sub>) and Pin 2 (FB). Use Multiple Vias to Tie Pin 4 Copper to Ground Plane. Use Vias at One Location Only to Avoid Introducing Switching Currents into the Ground Plane**

## APPLICATIONS INFORMATION

### Low-Battery Detector

The LT1949-1's low-battery detector is a simple PNP input gain stage with an open collector NPN output. The negative input of the gain stage is tied internally to a 200mV ±5% reference. The positive input is the LBI pin. Arrangement as a low-battery detector is straightforward.

Figure 5 details hookup. R1 and R2 need only be low enough in value so that the bias current of the LBI pin doesn't cause large errors. For R2, 49.9k is adequate. The 200mV reference can also be accessed as shown in Figure 6. The low-battery detector remains active in shutdown.
