

VOLTAGE CONVERTER

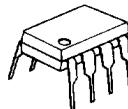

■ GENERAL DESCRIPTION

The NJU7660 is a voltage converter incorporated CR oscillator, voltage-level-shifter and power-MOS, which generates a polarity-converted negative voltage or twofold voltage of an operating voltage ranging from +1.5 to +10V.

The application circuit of negative voltage converter requires only two capacitors, and positive twofold voltage converter requires two capacitors, two resistors and one diode as external components.

The oscillation frequency of the internal oscillator is 5kHz and the negative voltage converter (on no-load condition) achieves extremely high-efficiency voltage conversion rate of 99.9%.

■ PACKAGE OUTLINE

NJU7660D

NJU7660M

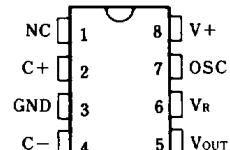

NJU7660V

■ FEATURES

- Polarity-converted Negative Voltage Output
- Twofold Positive Voltage Output
- Operating Voltage --- + 1.5 to +10.0V
(for Negative Voltage Converter)
- Operating Voltage --- + 3.0 to +10.0V
(for Positive Voltage Converter)
- High-efficiency Voltage Conversion Rate-- 99.9%
(No-load, Negative Voltage Converter)
- High-efficiency Power Conversion Rate
(Negative Voltage Converter)
- 2n times Voltage Output using cascade connection
- Few External Components
 - 2 Capacitors, (Negative Voltage Converter)
 - 2 Capacitors, 2 Resistors and 1 Diode
(Positive Voltage Converter)
- Package Outline DMP/DMP/SSOP8
- C-MOS Technology

(Note 1) The twofold positive converter operates over 3V.

(Note 2) The twofold positive converter requires 100Ω series resistor on power source terminal, therefore the output resistance increases to 200Ω.

■ MEASUREMENT CIRCUIT

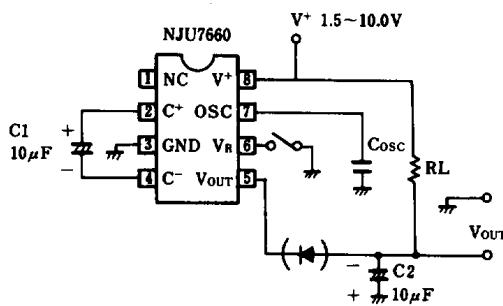

The measurement circuit diagram of negative voltage converter is shown below.

No. 6 terminal must connect to GND or Open according to the operating voltage as follows :

$V^+ < 3.5V$Connect to GND

$V^+ \geq 3.5V$OPEN

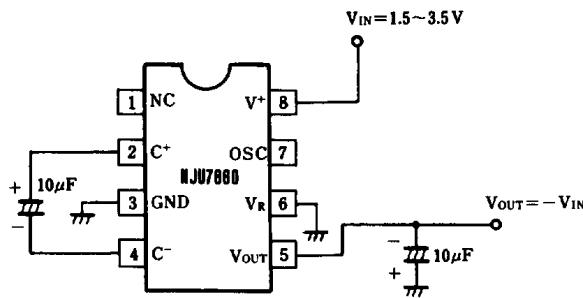

The oscillation frequency can be lowered by connecting external capacitor on the No.7 terminal, furthermore it can be also driven by external clock generator.

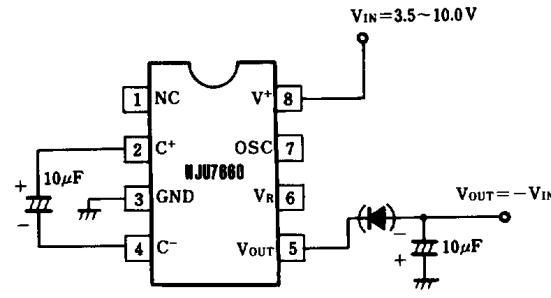

(Note 3) In case of the operation voltage is 6.5V or more, a Diode must be connected to No.5 terminal. If it is less than 6.5V, the Diode is not required.

■ APPLICATION CIRCUITS

(1-1) Negative Voltage Output 1
1.5 to 3.5V operation

(1-2) Negative Voltage Output 2
3.5 to 10.0V operation

(Note 4) No.6 terminal must connect to GND or Open according to the operating voltage as follows :

$V^+ < 3.5V$Connect to GND

$V^+ \geq 3.5V$OPEN

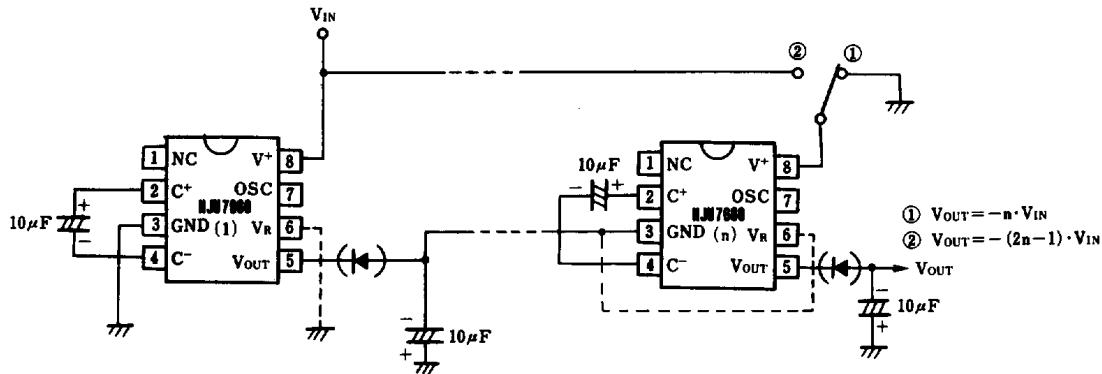

(Note 5) In case of the operation voltage is 6.5V or more, a Diode must be connected to No.5 terminal. If it is less than 6.5V, the Diode is not required.

(2) Twofold Positive Voltage Output

(Note 6) In the twofold positive voltage output application, R_1 , R_s and D_1 are required for start-up.
In this application, the input voltage is 3 to 10V.

(3) Cascade Connection (Negative Voltage Output)

(Note 7) No.6 terminal must connect to GND or Open according to the operating voltage as follows :
 $V^+ < 3.5V$Connect to GND
 $V^+ \geq 3.5V$OPEN

(Note 8) In case of the operation voltage is 6.5V or more, a Diode must be connected to No.5 terminal.
If it is less than 6.5V, the Diode is not required.

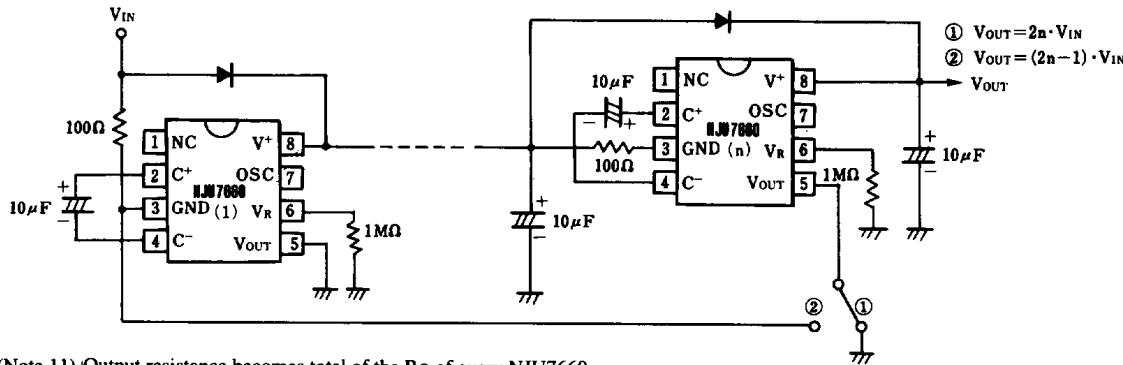

(Note 9) Output resistance becomes total of the R_O of every NJU7660.

(Note 10) In case of the cascade connection (Negative Voltage Output), No.6 terminals (after second IC's) must connect as follows, according to $V^+ - GND$ Voltage.

$V^+ - GND < 3.5V$GND

$V^+ - GND \geq 3.5V$OPEN

(4) Cascade Connection (Positive Voltage Output)

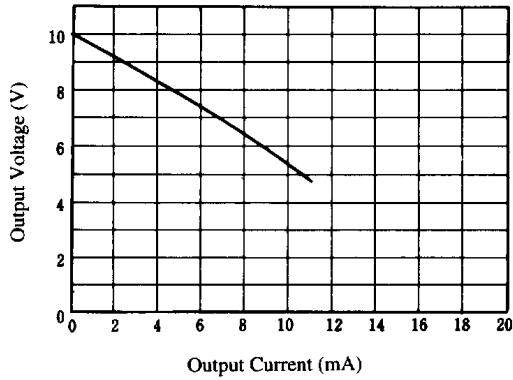

(Note 11) Output resistance becomes total of the R_O of every NJU7660.
