### Description

The ST750A is an adjustable output CMOS, step-down switching regulator. The ST750A accepts inputs between 4V and 11V and delivers 450mA. Typical efficiencies are 85% to 96%.

Quiescent supply current is 0.8mA and only 0.3mA in shutdown mode. The output does not exhibit frequency over this specified range. Pulse-width modulation (PWM) current-mode control

provides precise output regulation and excellent transient responses. Output voltage accuracy is guaranteed to be  $\pm 4.5\%$  plus feedback resistor tolerance over line, load, and temperature variations.

Fixed-frequency switching and absence of sub-harmonic ripple allows easy filtering of output ripple and noise, as well as the use of small external components. This regulators require only a single inductor value to work in most applications, so no inductor design is necessary. Typical applications are: Cellular phones & radios, portable Instruments, Portable Communications Equipment and Computer Peripherals.

Table 1. Pin description

Pin N°	Symbol	Name and function
1	$\overline{\text{SHDN}}$	Shutdown control (active low): If connected to GND the IC is in shutdown. Connect to $V_{CC}$ for normal operation (ON MODE)
2	REF	Reference output voltage: (1.25V): Bypass to GND with a capacitor that does not exceed 47nF
3	SS	Soft start: a capacitor between SS and GND provides soft-start and short-circuit protections.
4	CC	Compensation capacitor input: externally compensates the outer (voltage) feedback loop. Connect to OUT with 330pF capacitor
5	IC	Internal connection: make no external connection to this pin
6	GND	Ground
7	LX	Switch output. Drain of internal P-channel power MOSFET
8	$V_{CC}$	Supply voltage input. Bypass to GND with 1 $\mu$ F ceramic capacitance and large value electrolytic capacitor in parallel. The 1 $\mu$ F capacitor must be as close as possible to the GND and $V_{CC}$ pins
