24-Lane 3-Port PCI Express® Switch

89HPES24N3
Data Sheet

Device Overview

The 89HPES24N3 is a member of IDT's PRECISE™ family of PCI Express® switching solutions offering the next-generation I/O interconnect standard. The PES24N3 is a 24-lane, 3-port peripheral chip that performs PCI Express Base switching with a feature set optimized for high performance applications such as servers, storage, and communications/networking. It provides high-performance I/O connectivity and switching functions between a PCIe® upstream port and two downstream ports or peer-to-peer switching between downstream ports.

Features

- High Performance PCI Express Switch
  - *24 PCI Express lanes (2.5Gbps), 3 switch ports*
  - *Low latency cut-through switch architecture*
  - *Supports 128 to 2048 byte maximum payload size*
  - *Supports one virtual channel*
  - *PCI Express Base specification Revision 1.0a compliant*
- Flexible Architecture with Numerous Configuration Options
  - *Port arbitration schemes utilizing round robin or weighted round robin algorithms*
  - *Supports automatic per port link with negotiation (x8, x4, x2, or x1)*
  - *Supports static lane reversal on all ports*
  - *Supports polarity inversion*
  - *Supports locked transactions, allowing use with legacy software*
  - *Ability to load device configuration from serial EEPROM*
- Highly Integrated Solution
  - *Requires no external components*
  - *Incorporates on-chip internal memory for packet buffering and queueing*
  - *Integrates 24 2.5 Gbps embedded SerDes, 8B/10B encoder/decoder (no separate transceivers needed)*
- Reliability, Availability, and Serviceability (RAS) Features
  - *Internal end-to-end parity protection on all TLPs ensures data integrity even in systems that do not implement end-to-end CRC (ECRC)*
  - *Supports ECRC passed through*
  - *Supports PCI Express Native Hot-Plug*
    - *Compatible with Hot-Plug I/O expanders used on PC motherboards*
  - *Supports Hot-Swap*
- Power Management
  - *Supports PCI Power Management Interface specification, Revision 1.1 (PCI-PM)*
  - *Unused SerDes are disabled*
  - *Supports Advanced Configuration and Power Interface Specification, Revision 2.0 (ACPI) supporting active link state*
- Testability and Debug Features
  - *Built in SerDes Pseudo-Random Bit Stream (PRBS) generator*
  - *Ability to read and write any internal register via the SMBus*
  - *Ability to bypass link training and force any link into any mode*
  - *Provides statistics and performance counters*

Block Diagram

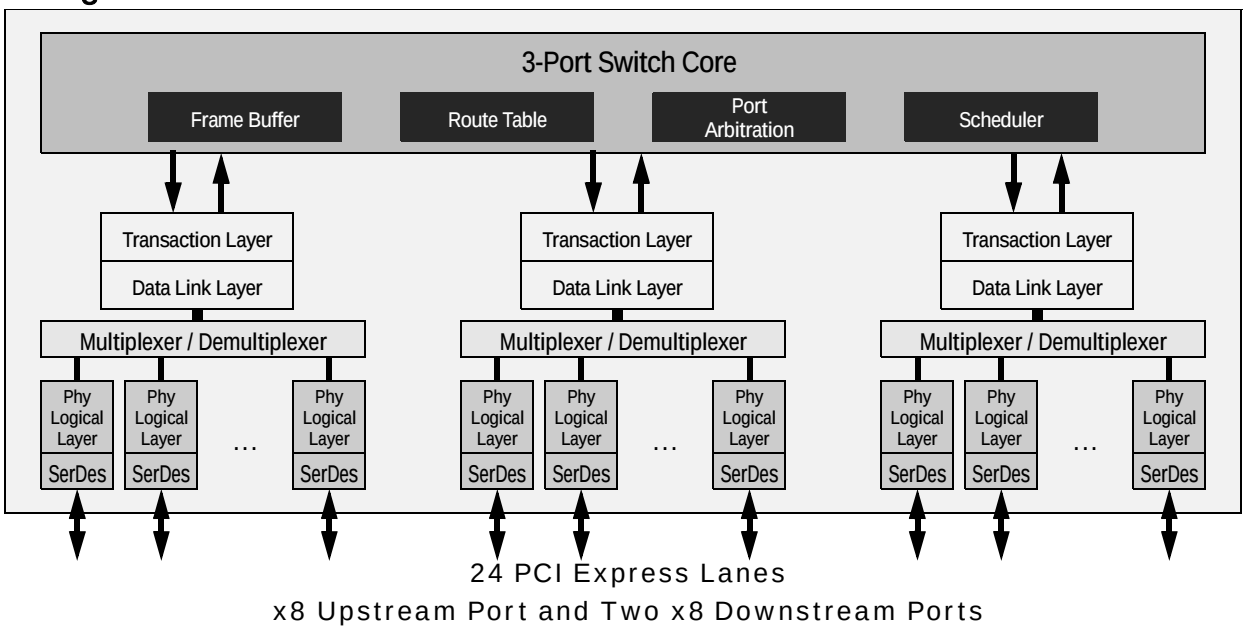

Figure 1 Internal Block Diagram

- Two SMBus Interfaces
  - *Slave interface provides full access to all software-visible registers by an external SMBus master*
  - *Master interface provides connection for an optional serial EEPROM used for initialization*
  - *Master interface is also used by an external Hot-Plug I/O expander*
  - *Master and slave interfaces may be tied together so the PES24N3 can act as both master and slave*
- 8 General Purpose Input/Output pins
- Packaged in 27x27mm 420 ball BGA with 1mm ball spacing

Product Description

Utilizing standard PCI Express interconnect, the PES24N3 provides the most efficient high-performance I/O connectivity solution for applications requiring high throughput, low latency, and simple board layout with a minimum number of board layers. It provides 12 GBps (96 Gbps) of aggregated, full-duplex switching capacity through 24 integrated serial lanes, using proven and robust IDT technology. Each lane provides 2.5 Gbps of bandwidth in both directions and is fully compliant with PCI Express Base specification 1.0a.

The PES24N3 is based on a flexible and efficient layered architecture. The PCI Express layer consists of SerDes, Physical, Data Link and Transaction layers in compliance with PCI Express Base specification Revision 1.0a. The PES24N3 can operate either as a store and forward or cut-through switch depending on the packet size and is designed to switch memory and I/O transactions. It supports eight Traffic Classes (TCs) and one Virtual Channel (VC) with sophisticated resource management. This includes system selectable algorithms such as round robin, weighted round-robin, and strict priority schemes guaranteeing bandwidth allocation and/or latency for critical traffic classes in applications such as high throughput 10 Gigabit I/Os, SATA controllers, and Fibre Channel HBAs.

Switch Configuration

The PES24N3 is a three port switch that contains 24 PCI Express lanes. Each of the three ports is statically allocated 8 lanes with ports labeled as A, B and C. Port A is always the upstream port while ports B and C are always downstream ports. The switch operating mode, as well as an optional initialization from a serial EEPROM, is selected via the Switch Mode (SWMODE[3:0]) inputs.

During link training, link width is automatically negotiated. Each PES24N3 port is capable of independently negotiating to a x8, x4, x2 or x1 width. Thus, the PES24N3 may be used in virtually any three port switch configuration (e.g., {x8, x8, x8}, {x4, x4, x4}, {x4, x2, x1}, etc.). The PES24N3 supports static lane reversal. For example, lane reversal for upstream port A may be configured by asserting the PCI Express Port A Lane Reverse (PEALREV) input signal or through serial EEPROM or SMBus initialization. Lane reversal for ports B and C may be enabled via a configuration space register, serial EEPROM, or the SMBus.

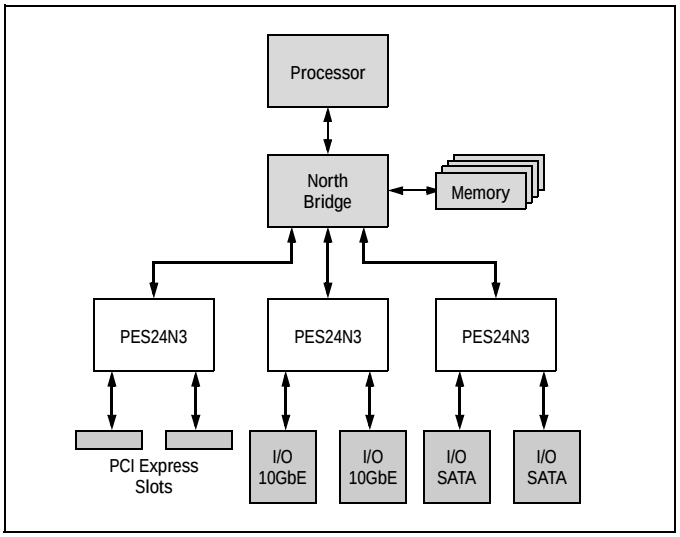

Figure 2 I/O Expansion Application

Pin Description

The following tables list the functions of the pins provided on the PES24N3. Some of the functions listed may be multiplexed onto the same pin. The active polarity of a signal is defined using a suffix. Signals ending with an "N" are defined as being active, or asserted, when at a logic zero (low) level. All other signals (including clocks, buses, and select lines) will be interpreted as being active, or asserted, when at a logic one (high) level.

Signal	Type	Name/Description
PEALREV	I	**PCI Express Port A Lane Reverse.** When this bit is asserted, the lanes of PCI Express Port A are reversed. This value may be overridden by modifying the value of the PALREV bit in the PA_SWCTL register.
PEARP[7:0] PEARN[7:0]	I	**PCI Express Port A Serial Data Receive.** Differential PCI Express receive pairs for port A.
PEATP[7:0] PEATN[7:0	O	**PCI Express Port A Serial Data Transmit.** Differential PCI Express transmit pairs for port A
PEBLREV	I	**PCI Express Port B Lane Reverse.** When this bit is asserted, the lanes of PCI Express Port B are reversed. This value may be overridden by modifying the value of the PBLREV bit in the PA_SWCTL register.
PEBRP[7:0] PEBRN[7:0]	I	**PCI Express Port B Serial Data Receive.** Differential PCI Express receive pairs for port B.
PEBTP[7:0] PEBTN[7:0]	O	**PCI Express Port B Serial Data Transmit.** Differential PCI Express transmit pairs for port B
PECLREV	I	**PCI Express Port C Lane Reverse.** When this bit is asserted, the lanes of PCI Express Port C are reversed. This value may be overridden by modifying the value of the PCLREV bit in the PA_SWCTL register.
PECRP[7:0] PECRN[7:0]	I	**PCI Express Port C Serial Data Receive.** Differential PCI Express receive pairs for port C.
PECTP[7:0] PECTN[7:0]	O	**PCI Express Port C Serial Data Transmit.** Differential PCI Express transmit pairs for port C
PEREFCLKP[1:0] PEREFCLKN[1:0]	I	**PCI Express Reference Clock.** Differential reference clock pair input. This clock is used as the reference clock by on-chip PLLs to generate the clocks required for the system logic and on-chip SerDes. The frequency of the differential reference clock is determined by the REFCLKM signal.
REFCLKM	I	**PCI Express Reference Clock Mode Select.** These signals select the frequency of the reference clock input. 0x0 - 100 MHz 0x1 - 125 MHz

Table 1 PCI Express Interface Pins

Signal	Type	Name/Description
MSMBADDR[4:1]	I	**Master SMBus Address.** These pins determine the SMBus address of the serial EEPROM from which configuration information is loaded.
MSMBCLK	I/O	**Master SMBus Clock.** This bidirectional signal is used to synchronize transfers on the master SMBus. This signal is active only when EEPROM data is being loaded.
MSMBDAT	I/O	**Master SMBus Data.** This bidirectional signal is used for data on the master SMBus.
SSMBADDR[5,3:1]	I	**Slave SMBus Address.** These pins determine the SMBus address to which the slave SMBus interface responds.
SSMBCLK	I/O	**Slave SMBus Clock.** This bidirectional signal is used to synchronize transfers on the slave SMBus.
SSMBDAT	I/O	**Slave SMBus Data.** This bidirectional signal is used for data on the slave SMBus.

Table 2 SMBus Interface Pins

Signal	Type	Name/Description
GPIO[0]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin.
GPIO[1]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin.
GPIO[2]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: IOEXPINTN Alternate function pin type: Input Alternate function: Hot-Plug I/O expander interrupt input
GPIO[3]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: PAABN Alternate function pin type: Input Alternate function: Port A attention button input
GPIO[4]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: PAAIN Alternate function pin type: Output Alternate function: Port A attention indicator output
GPIO[5]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin. Alternate function pin name: PAPIN Alternate function pin type: Output Alternate function: Port A power indicator output
GPIO[6]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin.
GPIO[7]	I/O	**General Purpose I/O.** This pin can be configured as a general purpose I/O pin.

Table 3 General Purpose I/O Pins

Signal	Type	Name/Description
CCLKDS	I	**Common Clock Downstream.** When the CCLKDS pin is asserted, it indicates that a common clock is being used between the downstream device and the downstream port.
CCLKUS	I	**Common Clock Upstream.** When the CCLKUS pin is asserted, it indicates that a common clock is being used between the upstream device and the upstream port.
MSMBSMODE	I	**Master SMBus Slow Mode.** The assertion of this pin indicates that the master SMBus should operate at 100 KHz instead of 400 KHz. This value may not be overridden.
PERSTN	I	**Fundamental Reset.** Assertion of this signal resets all logic inside the PES24N3 and initiates a PCI Express fundamental reset.
RSTHALT	I	**Reset Halt.** When this signal is asserted during a PCI Express fundamental reset, the PES24N3 executes the reset procedure and remains in a reset state with the Master and Slave SMBuses active. This allows software to read and write registers internal to the device before normal device operation begins. The device exits the reset state when the RSTHALT bit is cleared in the PA_SWCTL register by an SMBus master.
TSTRSVD	I	**Reserved.** Reserved for future test mode. Must be tied to ground.
SWMODE[3:0]	I	**Switch Mode.** These configuration pins determine the PES24N3 switch operating mode. 0x0 - Transparent mode 0x1 -Transparent mode with serial EEPROM initialization 0x2 through 0x7 - Reserved 0x8 - 10-bit loopback test mode 0x9 - Reserved 0xA - Internal pseudo random bit stream self-test test mode 0xB - External pseudo random bit stream self-test test mode 0xC - Reserved 0xD - SerDes broadcast test mode 0xE - 0xF Reserved

Table 4 System Pins

Signal	Type	Name/Description
JTAG_TCK	I	**JTAG Clock.** This is an input test clock used to clock the shifting of data into or out of the boundary scan logic or JTAG Controller. JTAG_TCK is independent of the system clock with a nominal 50% duty cycle.
JTAG_TDI	I	**JTAG Data Input.** This is the serial data input to the boundary scan logic or JTAG Controller.

Table 5 Test Pins (Part 1 of 2)

Signal	Type	Name/Description
JTAG_TDO	O	**JTAG Data Output**. This is the serial data shifted out from the boundary scan logic or JTAG Controller. When no data is being shifted out, this signal is tri-stated.
JTAG_TMS	I	**JTAG Mode**. The value on this signal controls the test mode select of the boundary scan logic or JTAG Controller.
JTAG_TRST_N	I	**JTAG Reset**. This active low signal asynchronously resets the boundary scan logic and JTAG TAP Controller. An external pull-up on the board is recommended to meet the JTAG specification in cases where the tester can access this signal. However, for systems running in functional mode, one of the following should occur: 1) actively drive this signal low with control logic 2) statically drive this signal low with an external pull-down on the board

Table 5 Test Pins (Part 2 of 2)

Signal	Type	Name/Description
V_{DD}CORE	I	**Core V_{DD}**. Power supply for core logic.
V_{DD}IO	I	**I/O V_{DD}**. LVTTL I/O buffer power supply.
V_{DD}PE	I	**PCI Express Digital Power**. PCI Express digital power used by the digital power of the SerDes.
V_{DD}APE	I	**PCI Express Analog Power**. PCI Express analog power used by the PLL and bias generator.
V_{TT}PE	I	**PCI Express Termination Power**.
V_{SS}	I	Ground.

Table 6 Power and Ground Pins

Pin Characteristics

Note: Some input pads of the PES24N3 do not contain internal pull-ups or pull-downs. Unused inputs should be tied off to appropriate levels. This is especially critical for unused control signal inputs which, if left floating, could adversely affect operation. Also, any input pin left floating can cause a slight increase in power consumption.

Function	Pin Name	Type	Buffer	I/O Type	Internal Resistor	Notes
PCI Express Interface	PEALREV	I	LVTTL	Input	pull-down	
	PEARN[7:0]	I	CML	Serial link		
	PEARP[7:0]	I				
	PEATN[7:0]	O				
	PEATP[7:0]	O				
	PEBLREV	I	LVTTL	Input	pull-down	
	PEBRN[7:0]	I	CML	Serial link		
	PEBRP[7:0]	I				
	PEBTN[7:0]	O				
	PEBTP[7:0]	O				
	PECLREV	I	LVTTL	Input	pull-down	
	PECRN[7:0]	I	CML	Serial link		
	PECRP[7:0]	I

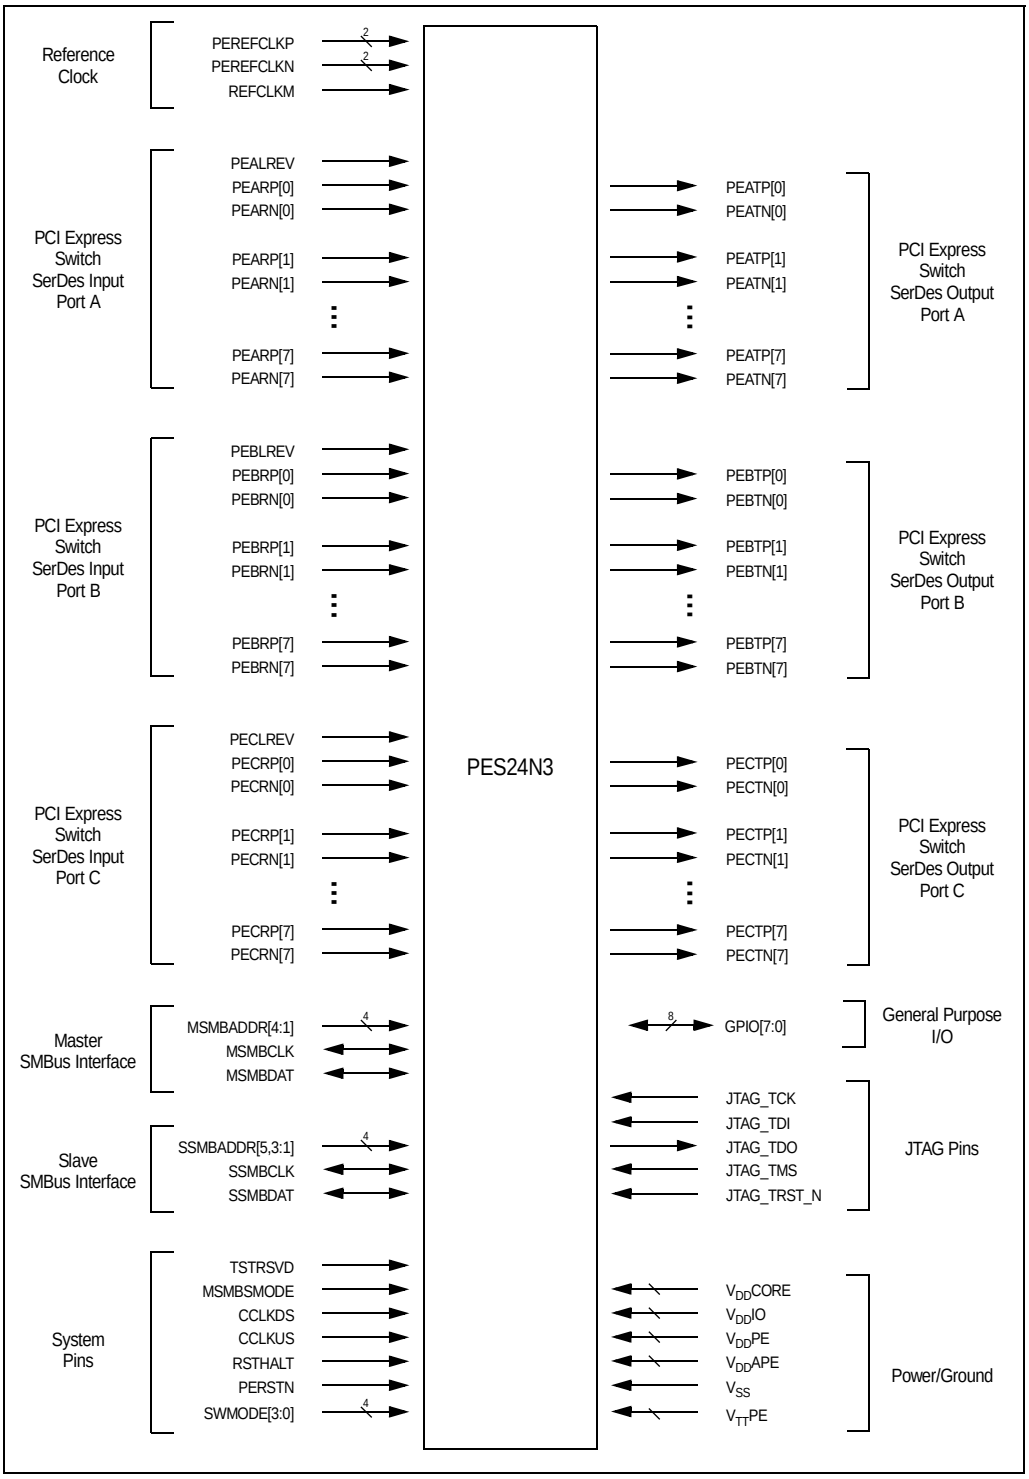

Figure 3 PES24N3 Logic Diagram

System Clock Parameters

Values based on systems running at recommended supply voltages and operating temperatures, as shown in Tables 12 and 13.

Parameter	Description	Min	Typical	Max	Unit
$Refclk_{FREQ}$	Input reference clock frequency range	100		125[1]	MHz
$Refclk_{DC}$[2]	Duty cycle of input clock	40	50	60	%
T_R, T_F	Rise/Fall time of input clocks			0.2*RCUI	RCUI[3]
V_{SW}	Differential input voltage swing[4]	0.6		1.6	V
T_{jitter}	Input clock jitter (cycle-to-cycle)			125	ps
R_T	Termination Resistor		110		Ohms

Table 8 Input Clock Requirements

1. The input clock frequency will be either 100 or 125 MHz depending on signal REFCLKM.
2. ClkIn must be AC coupled. Use 0.01 — 0.1 µF ceramic capacitors.
3. RCUI (Reference Clock Unit Interval) refers to the reference clock period.
4. AC coupling required.

AC Timing Characteristics

Parameter	Description	Min[1]	Typical[1]	Max[1]	Units
PCIe Transmit					
UI	Unit Interval	399.88	400	400.12	ps
T_{TX-EYE}	Minimum Tx Eye Width	0.7	.9		UI
$T_{TX-EYE-MEDIAN-to-MAX-JITTER}$	Maximum time between the jitter median and maximum deviation from the median			0.15	UI
$T_{TX-RISE}$, $T_{TX-FALL}$	D+ / D- Tx output rise/fall time	50	90		ps
$T_{TX- IDLE-MIN}$	Minimum time in idle	50			UI
$T_{TX-IDLE-SET-TO-IDLE}$	Maximum time to transition to a valid Idle after sending an Idle ordered set			20	UI
$T_{TX-IDLE-TO-DIFF-DATA}$	Maximum time to transition from valid idle to diff data			20	UI
$T_{TX-IDLE-RCV-DET-MAX}$	Max time spend in idle before initiating a RX detect sequence		20	100	ms
$T_{TX-SKEW}$	Transmitter data skew between any 2 lanes		500	1300	ps
PCIe Receive					
UI	Unit Interval	399.88	400	400.12	ps
T_{RX-EYE} (with jitter)	Minimum Receiver Eye Width (jitter tolerance)	0.4			UI

Table 9 PCIe AC Timing Characteristics (Part 1 of 2)

Parameter	Description	Min[1]	Typical[1]	Max[1]	Units
$T_{RX-EYE-MEDIUM\ TO\ MAX\ JITTER}$	Max time between jitter median & max deviation			0.3	UI
$T_{RX-IDLE-DET-DIFF-ENTER\ TIME}$	Unexpected Idle Enter Detect Threshold Integration Time			10	ms
$T_{RX-SKEW}$	Lane to lane input skew			20	ns

Table 9 PCIe AC Timing Characteristics (Part 2 of 2)

1. Minimum, Typical, and Maximum values meet the requirements under PCI Specification 1.0a

Signal	Symbol	Reference Edge	Min	Max	Unit	Timing Diagram Reference
GPIO						
GPIO[7:0][1]	Tpw_13b[2]	None	50	—	ns	

Table 10 GPIO AC Timing Characteristics

1. GPIO signals must meet the setup and hold times if they are synchronous or the minimum pulse width if they are asynchronous.

2. The values for this symbol were determined by calculation, not by testing.

Signal	Symbol	Reference Edge	Min	Max	Unit	Timing Diagram Reference
JTAG						
JTAG_TCK	Tper_16a	none	50.0	—	ns	See Figure 4.
	Thigh_16a, Tlow_16a		10.0	25.0	ns	
JTAG_TMS[1], JTAG_TDI	Tsu_16b	JTAG_TCK rising	2.4	—	ns	
	Thld_16b		1.0	—	ns	
JTAG_TDO	Tdo_16c	JTAG_TCK falling	—	20	ns	
	Tdz_16c[2]		—	20	ns	
JTAG_TRST_N	Tpw_16d[2]	none	25.0	—	ns	

Table 11 JTAG AC Timing Characteristics

1. The JTAG specification, IEEE 1149.1, recommends that JTAG_TMS should be held at 1 while the signal applied at JTAG_TRST_N changes from 0 to 1. Otherwise, a race may occur if JTAG_TRST_N is deasserted (going from low to high) on a rising edge of JTAG_TCK when JTAG_TMS is low, because the TAP controller might go to either the Run-Test/Idle state or stay in the Test-Logic-Reset state.

2. The values for this symbol were determined by calculation, not by testing.

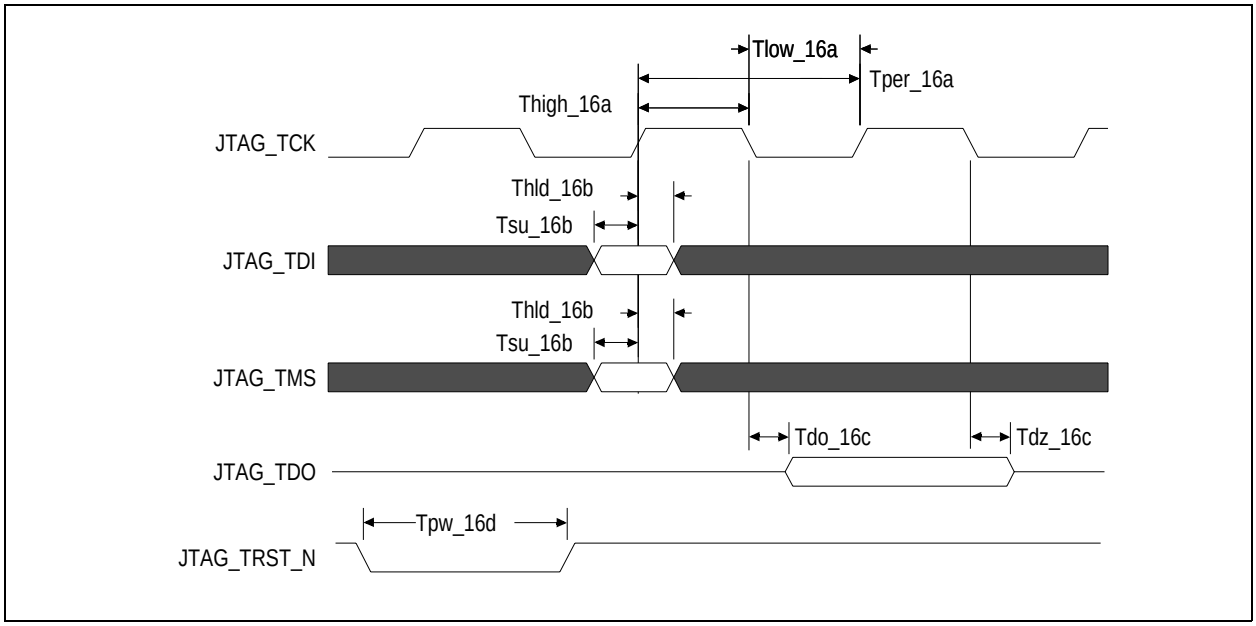

Figure 4 JTAG AC Timing Waveform

Recommended Operating Supply Voltages

Symbol	Parameter	Minimum	Typical	Maximum	Unit
V_{DD}CORE	Internal logic supply	0.9	1.0	1.1	V
V_{DD}I/O	I/O supply except for SerDes LVPECL/CML	3.135	3.3	3.465	V
V_{DD}PE	PCI Express Digital Power	0.9	1.0	1.1	V
V_{DD}APE	PCI Express Analog Power	0.9	1.0	1.1	V
V_{TT}PE	PCI Express Serial Data Transmit Termination Voltage	1.425	1.5	1.575	V
V_{SS}	Common ground	0	0	0	V

Table 12 PES24N3 Operating Voltages

Recommended Operating Temperature

Grade	Temperature
Commercial	0°C to +70°C Ambient

Table 13 PES24N3 Operating Temperatures

Power-Up Sequence

This section describes the sequence in which various voltages must be applied to the part during power-up to ensure proper functionality. For the PES24N3, the power-up sequence must be as follows:

1. V_{DD}I/O — 3.3V
2. V_{DD}Core, V_{DD}PE, V_{DD}APE — 1.0V
3. V_{TT}PE — 1.5V

When powering up, each voltage level must ramp and stabilize prior to applying the next voltage in the sequence to ensure internal latch-up issues are avoided. There are no maximum time limitations in ramping to valid power levels. The power-down sequence must be in the reverse order of the power-up sequence.

Power Consumption

Typical power is measured under the following conditions: 25°C Ambient, 35% total link usage on all ports, typical voltages defined in Table 14.

Maximum power is measured under the following conditions: 70°C Ambient, 85% total link usage on all ports, maximum voltages defined in Table 14.

All power measurements assume that the part is mounted on a 10 layer printed circuit board with 0 LFM airflow.

Number of Connected Lanes: Port-A/Port-B/Port-C	Core (Watts) (1.0V supply)		PCIe Digital (Watts) (1.0V supply)		PCIe Analog (Watts) (1.0V supply)		PCIe Termination (Watts) (1.5V supply)		I/O (Watts) (3.3V supply)		Total (Watts)	
	Typ	Max	Typ	Max	Typ	Max	Typ	Max	Typ	Max	Typ	Max
8/4/4	0.59	0.84	0.75	1.08	0.33	0.42	0.62	0.78	0.002	0.01	2.3	3.12

NOTES:

1. ALL DIMENSIONING AND TOLERANCING CONFORM TO ANSI Y14.5M–1982
2. "e" REPRESENTS THE BASIC SOLDER BALL GRID PITCH
3. "M" REPRESENTS THE MAXIMUM SOLDER BALL MATRIX SIZE
4. "N" REPRESENTS THE BALLCOUNT NUMBER
5. DIMENSION "b" IS MEASURED AT THE MAXIMUM SOLDER BALL DIAMETER, PARALLEL TO PRIMARY DATUM -C-
6. SEATING PLANE AND PRIMARY DATUM -C- ARE DEFINED BY THE SPHERICAL CROWNS OF THE SOLDER BALLS
7. "A1" ID CORNER MUST BE IDENTIFIED BY CHAMFER, INK MARK, METALLIZED MARKING, INDENTATION OR OTHER FEATURE ON PACKAGE BODY
8. EXACT SHAPE OF EACH CORNER IS OPTIONAL
9. ALL DIMENSIONS ARE IN MILLIMETERS

Revision History

July 18, 2006: Publication of YC data sheet.

April 4, 2007: In Table 2, revised description for MSMBCLK signal to include “active only when EEPROM data is being loaded.”

November 14, 2007: Added new parameter, Termination Resistor, to Table 8, Input Clock Requirements.

December 18, 2007: Added YD silicon revision.
