

## Switch Fabric Data Sheet

89TSF500

Preliminary Information\*

### Description

The 89TSF5xx is a complete switch fabric, consisting of two chips:

89TSF552 (*queuing engine, 10 Gbps*).

89TSF500 (*crossbar and scheduler*).

The 89TSF5xx switch fabric is a system of one or more queueing engines and one or more crossbar/schedulers. The main function of the 89TSF5xx is to route traffic from the source to the destination in a fair and efficient way. It can be configured in many ways that achieve fairness, balance loads, minimize traffic congestion, and protect against failure. These devices interconnect using sets of high-speed SerDes links. They are scalable, and bandwidth increases linearly when you add multiple 89TSF500s. A functional block diagram of the 89TSF500 is shown in Figure 1.

The 89TSF552 is the interface of a system port (usually equivalent to a line card<sup>1</sup>) to the 89TSF5xx switch fabric. The 89TSF500 is the "switch" of the 89TSF5xx switch fabric. Combined, they provide up to 10 Gbps switching bandwidth per system port and up to 32 system ports or 64 system subports<sup>2</sup> per system.

The 89TSF5xx switch fabric devices interconnect using high speed, serial links. The 89TSF5xx system can be implemented on a single shelf or on multiple shelves. Figure 2 is an example of a single-shelf system, while Figures 3 and 4 illustrate multiple-shelf systems.

The 89TSF5xx switch fabric has a modular and scalable architecture that gives system designers maximum flexibility and performance. This architecture allows a switch to be implemented either on a single shelf using an electrical backplane or on multiple shelves connected by optical transceivers, thus helping system vendors overcome physical space constraints.

The 89TSF500 consists of an integrated crossbar and a scheduler. It has a non-blocking architecture and supports up to 8 classes of service and spatial multicasting. It performs data switching and circuit switching concurrently, providing guaranteed bandwidth and fixed jitter for the circuit paths.

A single 89TSF500 has an aggregate bandwidth of 64 Gbps, full duplex, providing the benefits of high density, low cost, and low power. Multiple 89TSF500s can be combined to support system configurations up to 32 line cards at 10 Gbps, full duplex.

### 89TSF5xx Features

- Up to 32 switch ports, with 24 Gbps available per switch port.

<sup>1</sup> A 10 Gbps line card would have a single 89TSF552 and therefore that line card would be equivalent to a system port. However, a 20 Gbps line card would have two 89TSF552s and therefore that line card is equivalent to 2 system ports.

<sup>2</sup> One 89TSF552 can support up to 4 system subports.

- Variable length CSIX payload (up to 132 bytes) that supports any type of traffic.
- Virtual output queues (VOQs) in the ingress direction that eliminate head-of-line blocking. The 256 unicast VOQs provide:
  - A maximum of 32 ports with 8 CoS, or
  - A maximum of 16 ports with 4 subports and 4 CoS.
- Spatial multicast support with up to 4K global multicast labels. Each multicast label can specify from 1 to 32 ports.
- Efficient backpressure mechanism that eliminates cell loss caused by congestion.
- In-service scalable architecture.
- "Stackable" architecture. Total aggregate bandwidth is linearly proportional to the number of 89TSF500s. Port rate is configurable up to OC-192.
- Always non-blocking architecture across destination, traffic type (cell, packet), and class of service (CoS).
- Supports up to 4 egress subports per switch port.
- Carrier class reliability features:
  - Flexible architecture that allows the 89TSF switch fabric to be employed in a single switch shelf or in multiple switch shelves.
  - Automatic link diagnostics that detect faulty link connections.
  - Both n+m (load-sharing mode) and 1:1 protection (active/standby mode) on serial links.
  - Patented error correction scheme to reduce the system bit error rate by 10<sup>6</sup>.
  - Line cord redundancy via Redundant Destination Mapping (RDM) and Queue-Mapped Redundancy (QMR).
  - Dynamic 89TSF500 rerouting that avoids congested or faulty 89TSF500s.
  - Zero cell loss during controlled switchover to standby 89TSF500s.
- Advanced diagnostic features including multiple loopback paths.
- Unicast and multicast traffic with up to 8 classes of service.
- Industry-standard CSIX-over-LVDS interface.
- Backward compatibility with IDT's ZSF200 switch fabric.

### 89TSF500 Features

- 32 embedded SerDes links per device at 2.5 Gbps per link.
- Linear scalability for higher aggregate port density.
- Combined unicast and multicast scheduling.
- Clock synchronization and cell alignment across the fabric.
- External processor interface for register config. and status.

## 89TTSF500 Pin Description

**Note:** Information in this section is subject to change. Contact your IDT FAE before making design decisions.

In this data sheet, direction is indicated as follows: I for In, O for Out, B for Bidirectional, and P for power.

Signal Name	I/O Type	Dir.	Freq.	Remarks
SYS_CLK (pin AA1)	3.3V LVTTL	I	125 MHz	N/A
PLL_CORE_LCK (pin AA3)	3.3V LVTTL	O	—	N/A
PLL_SYS_LCK (pin W3)	3.3V LVTTL	O	—	N/A
PLL_DIV_RST_N (pin U2)	3.3V LVTTL	I	—	33K $\Omega$ internal pullup
PLL_RST (pin AB3)	3.3V LVTTL	I	—	33K $\Omega$ internal pullup
PLL_CORE_VDDA (pin AB8)	1.8V AVDD	P	—	Supply
PLL_CORE_VSSA (pin AA8)	AVSS	P	—	Supply
PLL_CORE_VDD (pin AB6)	1.8V AVDD	P	—	Supply
PLL_CORE_VSS (pin AA6)	VSS	P	—	Supply
PLL_SYS_VDDA (pin V6)	3.3V AVDD	P	—	Supply
PLL_SYS_VSSA (pin W6)	AVSS	P	—	Supply
PLL_SYS_VDD (pin V8)	1.8V AVDD	P	—	Supply
PLL_SYS_VSS (pin W8)	VSS	P	—	Supply

Table 1 89TSF500 PLL Control and Power Pins

Signal Name	I/O Type	Dir.	Freq.	Remarks
SD[2:0]_REFCLKN (pins A24, Y39, AW25)	Serdess diff input	I	250MHz	Reference clocks for both Rx and Tx. The reference clock (SD[n]_REFCLKN and SD[n]_REFCLKP) must be synchronous to twice the system clock (SYS_CLK) input. If an entire SerDes group is not used, the reference clock pins for that group should be pulled down to VSS using a 300 $\Omega$ to 1k $\Omega$ resistor.
SD[2:0]_REFCLKP (pins A25, AA39, AW24)	Serdess diff input	I	250MHz	
SD[2:0]_REF_RES (pins D25, AA36, AT24)	Serdess Bidi	O	—	Reference resistor pins used to generate bias currents for both Rx and Tx. To ensure proper biasing, connect each of these to VSS through a 3.09 k $\Omega$ 1% resistor. If an entire SerDes group is not used, the reference resistor pins for that group should be connected to VDD_SD (1.8V).
VDD_SD[2:0]_PLL (pins J23, Y31, AL23)	VAA18	P	—	SerDes common VDD = 1.8V. These are PLL analog power pins and must be well filtered.
VSS_SD[2:0]_PLL (pins K22, W30, AK24)	VSS	P	—	SerDes PLL ground
VDD_REFCLK[2:0] (pins J24, AA31, AL22)	VAA33	P	—	SerDes common VDD = 3.3V

Table 2 89TSF500 SerDes Pins (Part 1 of 2)

Signal Name	I/O Type	Dir.	Freq.	Remarks
RXN[31:0]	Serdes diff input	I	—	SerDes Rx pairs. Unused pins may be left unconnected.
RXP[31:0]	Serdes diff input	I	—	
TXN[31:0]	Serdes diff input	O	—	SerDes Tx pairs. Unused pins may be left unconnected.
TXP[31:0]	Serdes diff input	O	—	
VDD_SD	VAA18	P	—	SerDes VDD = 1.8V
VDD_TX	VAA25	P	—	SerDes Tx VDD (2.5V)

Table 2 89TSF500 SerDes Pins (Part 2 of 2)

Signal Name	Type	Dir.	Freq.	Remarks
ZBUS_AVALID_N (pin AT5)	3.3V LVTTL	I	33MHz	33K Ω internal pullup
ZBUS_CLK (pin AV3)	3.3V LVTTL	I	33MHz	N/A
ZBUS_AD[15:0]	3.3V LVTTL	B	33MHz	33K Ω internal pullup
ZBUS_DEVID[4:0]	3.3V LVTTL	I	—	33K Ω internal pullup
ZBUS_DVALID_N (pin AV10)	3.3V LVTTL	B	33MHz	33K Ω internal pullup
ZBUS_INT_N[2:0] (pins AW11, AU11, AW9)	3.3V LVTTL	O	—	33K Ω internal pullup
ZBUS_PRTY (pin AV9)	3.3V LVTTL	B	33MHz	33K Ω internal pullup

Table 3 89TSF500 ZBus Pins

Signal Name	I/O Type	Dir.	Freq.	Remarks
TCK (pin A11)	3.3V LVTTL	I	—	33K internal pullup
TDI (pin A10)	3.3V LVTTL	I	—	33K internal pullup
TDO (pin B11)	3.3V LVTTL	O	—	33K internal pullup
TMS (pin C11)	3.3V LVTTL	I	—	33K internal pullup
TRST_N (pin B10)	3.3V LVTTL	I	—	33K internal pullup

Table 4 89TSF500 Test and Debugging Pins

Signal Name	I/O Type	Dir.	Freq.	Remarks
ZTICK (pin V4)	3.3V LVTTL	I	—	External reference ZTick input to which the internal ZTick logic will synchronize. If ZTICK_MODE is 0, ZTICK can be left open.
ZTICK_MODE (pin V2)	3.3V LVTTL	I	—	External ZTick select. 1 = Device uses externally generated ZTicks 0 = Device uses internally generated ZTicks. Pin(s) must be stable at least 16 ns before the deassertion of the RESET_N input. Any change in pin(s) after 16 ns before the deassertion of the RESET_N input must be concurrent with, or followed by, an assertion of the RESET_N input.

Table 5 89TSF500 ZTick Management Pins

Signal Name	I/O Type	Dir.	Freq.	Remarks
RESET_N (pin AR3)	3.3V LVTTL	I	Async	100K internal pullup
CHN_DET_MODE (pin AU2)	3.3V LVTTL	I	N/A	33K pullup
VDD	VDD18	P	—	1.8V
VDD_IO	VDD33	P	—	3.3V
VSS	VSS	P	—	Ground

Table 6 89TSF500 Misc. Pins

## 89TSF500 Electrical Specifications

Some data are TBD and will be published as they become available.

The specifications are subject to change without notice.

### 89TSF500 Absolute Maximum Ratings

The absolute maximum ratings are the maximum conditions that the device can withstand without sustaining permanent damage. Exceeding any of these conditions could result in permanent damage to the device. Normal operation should not be expected at these conditions. In addition, exposure to absolute maximum rated conditions (or near absolute maximum rated conditions) for extended periods may affect device reliability.

Operation of the device is not guaranteed at the absolute maximum ratings, but rather at the operating conditions outlined in Table 8.

Symbol	Parameter	Min	Max	Units	Conditions
T <sub>JMAX</sub>	Junction temperature under bias	—	105	°C	
T <sub>STORAGE</sub>	Storage temperature	—	150	°C	
	Storage temperature range	-40	85	°C	Long term storage
T <sub>SOLDER</sub>	Soldering temperature	—	215	°C	
T <sub>REWORK</sub>	Rework temperature	—	204	°C	

Table 7 89TSF500 Absolute Maximum Ratings (Part 1 of 2)

Symbol	Parameter	Min	Max	Units	Conditions
$T_{GP\_SOLDER}$	Soldering temperature for green package	—	245	°C	
$T_{GP\_REWORK}$	Rework temperature for green package	—	245	°C	
$V_{IO}$	I/O terminal voltage	-0.6	VDD+0.6	V	longer than 1 ns
		-1.0	VDD+1.0	V	pulse ≤ 1 ns

Table 7 89TSF500 Absolute Maximum Ratings (Part 2 of 2)

## 89TSF500 Operating Ranges

Symbol	Parameter	Min	Typical	Max	Units	Conditions
$T_J$	Operating junction temperature range	0	—	85	°C	
$V_{VDD}$	Core digital 1.8V power supply	1.71	1.8	1.89	V	±5%
$V_{PLL\_SYS\_VDD}$ , $V_{PLL\_CORE\_VDD}$	PLL digital 1.8V power supply	1.71	1.8	1.89	V	±5%
$V_{PLL\_SYS\_VDDA}$ , $V_{PLL\_CORE\_VDDA}$	PLL analog 3.3V power supply	3.135	3.3	3.465	V	±5%
$V_{VDD\_IO}$	LVTTL 3.3V I/O 3.3V power supply	3.135	3.3	3.465	V	±5%
$V_{VDD\_SD}$	SerDes Core 1.8V power supply	1.71	1.8	1.89	V	±5%
$V_{VDD\_SD\_PLL}$	SerDes PLL 1.8V power supply	1.71	1.8	1.89	V	±5%
$V_{VDD\_TX}$	SerDes transmit 2.5V power supply	2.375	2.5	2.625	V	±5%
$V_{VDD\_REFCLK}$	SerDes reference clock 3.3V power supply	3.135	3.3	3.465	V	±5%
—	SerDes power supply voltage noise (all power supplies)	—	—	TBD	mV	Peak-to-peak (50 kHz to 100 MHz)
Power Dissipation		—	17.39	21.06	W	Max. values use the maximum voltages and current listed in this table and typical values use the typical voltages and current.

Table 8 89TSF500 Operating Ranges

## 89TSF500 DC Characteristics

Unless otherwise stated, the following parameters are provided given the conditions outlined in Table 8.

Symbol	Parameter	Min	Typical	Max	Units	Conditions
$I_{VDD}$	Input current for core digital 1.8V power supply	—	4250	4930	mA	"Typical" here means max. load, nominal voltage
$I_{PLL\_SYS\_VDD}, I_{PLL\_CORE\_VDD}$	Input current for PLL digital 1.8V power supply	—	1.7	1.9	mA	"Typical" here means max. load, nominal voltage
$I_{PLL\_SYS\_VDDA}, I_{PLL\_CORE\_VDDA}$	Input current for PLL analog 3.3V power supply	—	0.35	0.4	mA	"Typical" here means max. load, nominal voltage
$I_{VDD\_IO}$	Input current for LVTTL 3.3V I/O power supply	—	160	187	mA	"Typical" here means max. load, nominal voltage
$I_{VDD\_SD}$	Input current for SerDes core 1.8V power supply	—	3300	3764	mA	"Typical" here means max. load, nominal voltage
$I_{VDD\_SD\_PLL}$	Input current for SerDes PLL 1.8V power supply	—	210	270	mA	"Typical" here means max. load, nominal voltage
$I_{VDD\_TX}$	Input current for SerDes transmitters 2.5V power supply	—	1150	1317	mA	"Typical" here means max. load, nominal voltage
$I_{VDD\_REFCLK}$	Input current for SerDes reference clock buffer 3.3V power supply	—	3	3	mA	"Typical" here means max. load, nominal voltage
$I_{IL33}$	Input leakage low current for 3.3V I/O	-5	—	5	$\mu A$	
$I_{IH33}$	Input leakage high current for 3.3V I/O	-5	—	5	$\mu A$	
$I_{IL33PU}$	Input leakage low current for 3.3V I/O with internal pullup	-80	—	5	$\mu A$	
$I_{IH33PU}$	Input leakage high current for 3.3V I/O with internal pullup	-5	—	5	$\mu A$	
$I_{IL33PD}$	Input leakage low current for 3.3V I/O with internal pulldown	-5	—	5	$\mu A$	
$I_{IH33PD}$	Input leakage high current for 3.3V I/O with internal pulldown	+5	—	+200	$\mu A$	
$V_{IL33}$	Input low voltage for 3.3V I/O	-0.3	—	0.8	V	
$V_{IH33}$	Input high voltage for 3.3V I/O	2.0	—	$VDD_{LVTTL33} + 0.5$	V	
$V_{OL33}$	Output low voltage for 3.3V I/O	—	—	0.4	V	$I = 12\text{ mA}$ for 12 mA drivers and $16\text{ mA}$ for 16 mA drivers
$V_{OH33}$	Output high voltage for 3.3V I/O	2.4	—	—	V	$I = -12\text{ mA}$ for 12 mA drivers and $-16\text{ mA}$ for 16 mA drivers

Table 9 89TSF500 DC Characteristics

**89TSF500 AC Characteristics**

Unless otherwise stated, the following parameters are provided given the conditions outlined in Table 8.

Symbol	Parameter	Min	Typical	Max	Units
$f_{SYS}$	System clock frequency (125 MHz $\pm 0.1$ MHz)	124.9	125	125.1	MHz
$T_{JSYS}$	Jitter requirements (peak to peak) for system clock. Peak to peak jitter requirements apply to entire range of allowed system clock frequencies.	—	—	100	ps
$D_{SYS}$	Percentage duty cycle for system clock	45	50	55	%
$T_{RSYSCI}$	System clock input rise time (10% to 90%)	—	—	TBD	ns
$T_{FSYSCI}$	System clock input fall time (90% to 10%)	—	—	TBD	ns

Table 10 89TSF500 System Clock Timing

Symbol	Parameter	Min	Typical	Max	Units
$f_{ZB}$	ZBus clock frequency	30	$f_{SYS} / 4$	33.1	MHz
$D_{ZB}$	Percentage duty cycle for ZBus clock	45	50	55	%
$T_{RZBCI}$	ZBus clock input rise time (10% to 90%)	—	—	TBD	ns
$T_{FZBCI}$	ZBus clock input fall time (90% to 10%)	—	—	TBD	ns

Table 11 89TSF500 ZBus Clock Timing

Symbol	Parameter	Min	Typical	Max	Units
$T_{KOVZB}$	ZBus clock rising edge to output valid	—	—	10.0	ns
$T_{KOXZB}$	ZBus clock rising edge to output invalid	1.0	—	—	ns
$T_{KOLZZB}$	ZBus clock rising edge to output low Z	1.0	—	10.0	ns
$T_{KOHZZB}$	ZBus clock rising edge to output high Z	1.0	—	10.0	ns
$T_{S2B}$	Input setup time from ZBus clock rising edge	5.0	—	—	ns
$T_{H2B}$	Input hold time from ZBus clock rising edge	1.0	—	—	ns
$T_{RZBI}$	Input rise time (10% to 90%)	—	—	TBD	ns
$T_{FZBI}$	Input fall time (90% to 10%)	—	—	TBD	ns

## 89TSF500 Thermal Considerations

This section describes the temperature and heat sink calculations for flip-chip BGA devices.

Symbol	Parameter	Value	Units	Conditions
$\theta_{JA}$	Thermal resistance, junction to ambient (no heat sink)	9.0	°C / W	Still air
		5.5	°C / W	200 FPM
		4.5	°C / W	500 FPM
$\theta_{JB}$	Estimated thermal resistance, junction to board	2.2	°C / W	
$\theta_{JC}$	Thermal resistance, junction to case	0.19	°C / W	

Table 21 89TSF500 Thermal Characteristics

The thermal circuit is as shown below.

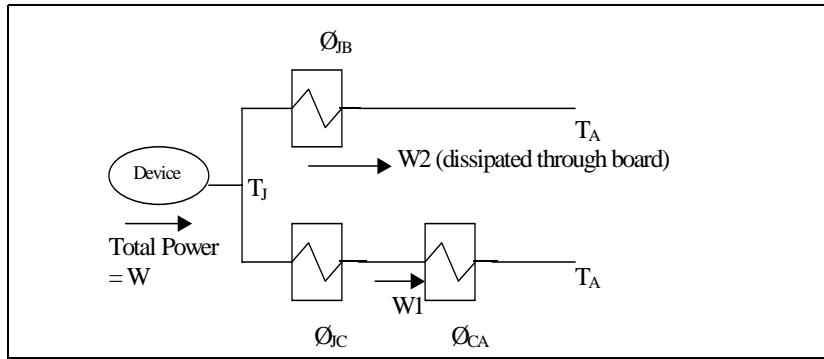

Figure 10 89TSF500 Thermal Circuit

For flip-chip BGA devices, there are two paths for heat dissipation: one through the package balls to the board and other through the package case to air. The device specifications provide  $\theta_{JB}$  and  $\theta_{JC}$  numbers. The  $\theta_{CA}$  number comes from the heat sink manufacturer and depends on type of heat sink (area, height, fin type, etc.) and the airflow across the heat sink. The device specifications also provide the maximum operating junction temperature ( $T_J$ ) that will not degrade the device reliability. The system designer should ensure that the device maximum junction temperature is not exceeded under any operating condition. One method of accomplishing this is to calculate the maximum ambient temperature ( $T_A$ ) that can be tolerated based on the above device parameters. The formula is shown below.

$$\theta_{JB} \times (\theta_{JC} + \theta_{CA})$$

$$T_A = T_J - W \times \frac{1}{\theta_{JB} + \theta_{JC} + \theta_{CA}}$$

$$\theta_{JB} + \theta_{JC} + \theta_{CA}$$

The following graph depicts the ambient temperature ( $T_A$ ) versus  $\varnothing_{CA}$ .

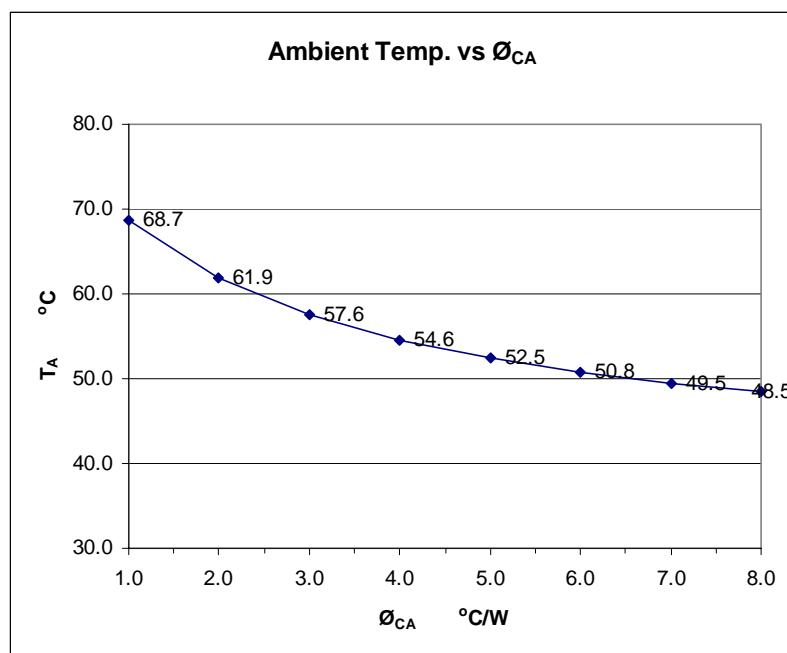

Figure 11 89TSF500 Ambient Temperature Curve

For system designers, specification of the maximum device junction temperature (operating) is critical, since it allows them to select a heat sink that meets the maximum ambient temperature requirements of their system.

The other parameter that is device package-specific is  $\varnothing_{JA}$ , without a heat sink, and is specified for various air-flow conditions. This is the intrinsic thermal resistance of the package (junction to case + case to ambient) and is mainly specified as a reference parameter. (This is when a heat sink is not present and the top surface of the package is essentially acting as the heat sink). However, in devices that have high power dissipation, heat sink usage is highly desirable. Consequently, system designers may have limited use for this parameter.

# 89TSF500 Power, Reset, and Initialization Sequencing Requirements

## Power Supply Power-Up Sequence

There is a power supply power-up sequence requirement that addresses potential latchup issues with some I/O buffers. All 3.3V I/O power must ramp up before all other power supply pins:

- 3.3V I/O ( $VDD_{IO}$ ,  $VDDP33$ ,  $VDD_{REFCLKn}$ )
- All other power supply pins

Further, IDT recommends that the designer use current limiting resistors on the bidirectional ZBus pins to limit potential high transient current from short-circuit current or bus contention during the power-up period. Such events can occur because of an unknown state of output enable of the bidirectional buffers. After core power ramps up (with RESET\_N asserted), the bidirectional I/O lines enter normal operating mode.

## Power Supply Power-Down Sequence

Because the power supply power-off state clears any latchup condition, the power-down sequence is not dictated by latchup. However, potential high transient current from short-circuit current or bus contention can also occur during the power-down period. We recommend appropriate sequencing. All 3.3V I/O power should ramp down before the 1.8V core ( $VDD$ ) power:

- 3.3V I/O ( $VDD_{IO}$ )
- 1.8V core ( $VDD$ )

However, if appropriate current limiting techniques (e.g., series resistors) are employed and the 2.5V and 1.5V power supplies ramp down soon after the 1.8V core power supply (within about 50 ms), the system designer can safely ignore this recommendation.

## PLL Power-Up Initialization

PLL inputs into the 89TSF500, from an external device such as the ZBus bridge in IDT's reference system, require a special initialization sequence. Figure 12 shows the initialization sequence.

PLL initialization is necessary only at power-up. If the PLLs fail to lock, repeatedly assert PLL\_RST until they do.

**Note:** The 89TSF500 must be reset *after* PLL initialization. Hold RESET\_N low for at least 16 clocks (SYS\_CLK) after PLL initialization completes.

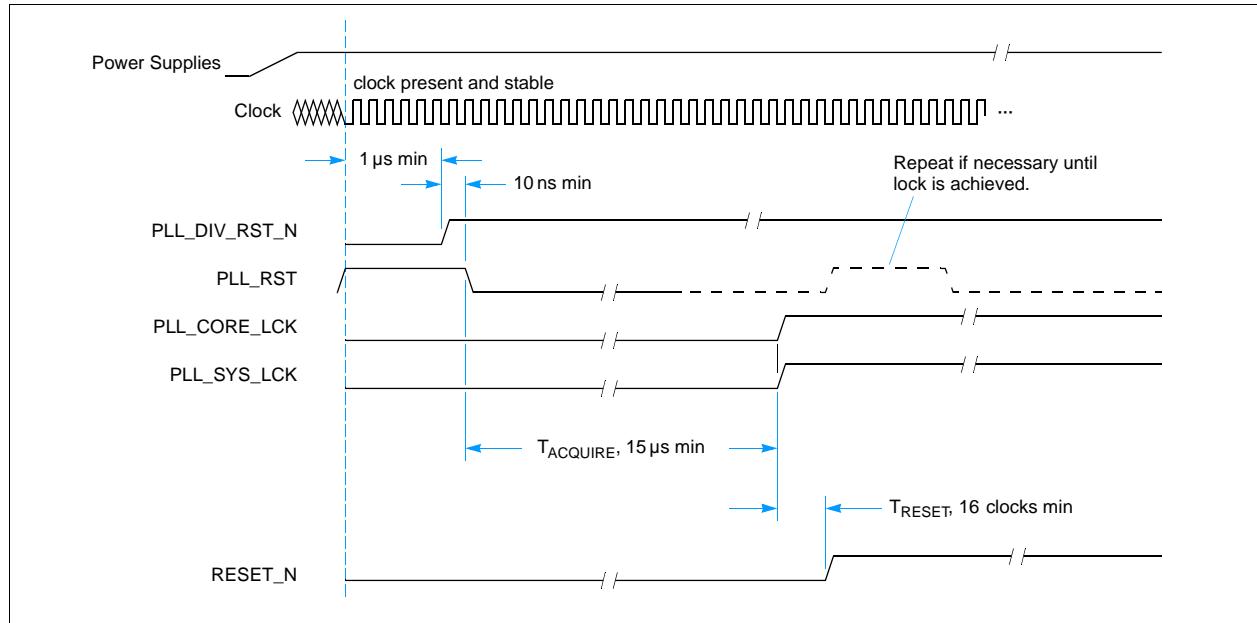

Figure 12 PLL Power-Up Initialization for the 89TSF500

## Device Reset

It is possible to reset the entire 89TSF500 except for the PLL. To reset the device without being required to re-initialize the PLL, assert the RESET\_N pin (low) for at least 16 clocks (SYS\_CLK) and then deassert it.

## Pin List I/O Description

The 89TSF500 Pin List on page 18 uses the following I/O notations:

I	Input
O	Output
B	Bidirectional
P	Power
DNC	Do not connect
RPD	Reserved, pulldown. Pin <b>must</b> be connected to VSS through a 300 - 1K $\Omega$ resistor.
RPU	Reserved, pullup. Pin is connected to VDD_IO (3.3V) through a 1K - 10K $\Omega$ resistor.

## 89TSF500 Package Diagram

The 89TSF500 package is an Amkor FCBGA, having 1517 pins, with 1 mm pitch; a 39x39 pin array; and a 40x40 mm enclosure. The package geometry is shown below.

## Ordering Information

### Valid Combinations

89TSF500BL

1517-pin FCBGA package, Commercial Temperature

### Revision History

November 23, 2004: Initial publication by IDT.
