LCD Terminal AppMod (#29121) 2 Line x 8 Character LCD Module with User Buttons

Introduction

The LCD Terminal AppMod provides a simple and convenient method of adding a standard character LCD and 4 user-input buttons to BASIC Stamp projects. Its 20-pin male header plugs into the 2x10 AppMod Header socket on the Parallax Board of Education (#28150, #28850) or Super Carrier Board (#27130).

Features

LCD Terminal AppMod (#29121)

Board Installation

The LCD Terminal AppMod's 20-pin male header plugs directly into the 2x10 socket. Before installation, be sure to check the board silkscreen labels for proper orientation. The photos below show the proper orientation on a Super Carrier Board (left) and a Board of Education (right). Use caution: reversing the connection could result in applying power to the LCD's ground pins and could damage your unit.

LCD Terminal AppMod (#29121)

Circuit Notes

The resistor values are important for the proper operation of the circuit. You may be wondering if the LCD will be adversely affected if a button is pressed while the BASIC Stamp is writing to it. The answer is no. When no buttons are pressed, the signals from the BASIC Stamp microcontroller are felt "across" the 10K resistors, hence there is no concern. When a button is pressed, a high level will be exerted on the bus. If the state of that buss line is supposed to be low, the BASIC Stamp overcomes the button press and a small amount of current will flow through the 1K resistor and the low exerted by the BASIC Stamp pin will be seen by the LCD.

BASIC Stamp 2 Application

The following BASIC Stamp program demonstrates many of the capabilities of the LCD and how the user is able to read and debounce the module's user buttons. This program is somewhat unique in that it is compatible with every BASIC Stamp 2 module; no changes are required. If you attempt to run the program on something other than a standard BS2, the compiler will ask if you want to run on the installed Stamp (BS2e, BS2sx, BS2p, or BS2pe). If you do, the program will run without problems.

In order to allow this program to take advantage of the built-in LCD features of the BS2p family, conditional compilation directives are used. Conditional compilation directives are evaluated before the program is compiled and downloaded to the BASIC Stamp, so only those portions that pertain to the installed BASIC Stamp will be downloaded; not the entire listing.

The program is guite straightforward, and uses a simple software trick to scroll a string through the small window (eight characters) of the LCD. Entry and exit of the string is facilitated by padding the string with spaces on either end.

   ' -----[ Program Description ]------
' This program demonstrates the use of the Parallax LCD Terminal AppMod
' with any BS2-series microcontroller. This program uses conditional
' compilation techniques which make it completely BS2-agnostic. Custom
' character generation and animation is demonstrated.
' -----[ I/O Definitions ]------
