1 Getting Started

Figure 1: VK202-25

The VK202-25 is an intelligent VFD display designed to decrease development time by providing an instant solution to any project. With the ability to communicate via serial RS-232/TTL and I²C protocols, the versatile VK202-25 can be used with virtually any controller. The ease of use is further enhanced by an intuitive command structure to allow display settings such as brightness, and baud rate to be software controlled. Additionally, up to thirty-two custom characters, such as character sets for bar graphs, medium and large numbers, may be stored in the non-volatile memory to be easily recalled and displayed at any time.

1.1 Display Options Available

The VK202-25 is complimented with a wide selection of filters including blue, green, grey and red. If the VFD will be in direct sunlight, the grey filter will prevent the displayed text from 'washing out'. Extended voltage, and temperature options are also available, to allow you to select the display which will best fit your project needs.

Figure 2: VK202-25 Filter Options

1.2 Accessories

NOTE Matrix Orbital provides all the interface accessories needed to get your display up and running. You will find these accessories and others on our e-commerce website at <http://www.matrixorbital.com>. To contact a sales associate see Section 14.5 on page 54 for contact information.

Figure 12: 4X4 Keypad

1.3 Features

- 20 column by 2 line text vacuum fluorescent display
- Selectable communication protocol, RS-232 or I²C
- Optional One-wire interface
- Six, 5V -20mA, general purpose outputs for a variety of applications
- Lightning fast communication speeds, up to 57.6 kbps for RS-232 and 400 kbps for I²C
- Default 19.2 kbps serial communication speed
- Extended temperature available for extreme environments of -40C to 85C
- Extended voltage and efficient power supply available
- Built in font with provision for up to 8 user defined characters
- Use of up to 127 modules on the same 2 wire I²C interface
- 1-wire bus that is capable of communicating with many devices over a single wire plus a ground reference
- Fully buffered so that no delays in transmission are ever necessary
- Ability to add a customized splash / startup screen
- Software controlled brightness with configurable time-out setting up to 90 minutes and software controlled speed
- Use of up to a 25 key keypad with a 10 key buffer
- Horizontal or vertical bar graphs
- Extended temperature option
- Fits Matrix Orbital's mountings without any modifications

1.4 Connecting to a PC

The VK202-25 connects seamlessly to a PC and it is an excellent means of testing the functionality. To connect your display to a PC, you will require a standard RS-232 9-pin serial cable such as the one pictured in *figure 6 on page 3*, as well as a modified 5V power adapter such as the one pictured in *figure 3 on page 2*.

In order to connect your display to a personal computer follow these easy instructions:

1. Plug the serial cable into the com port you wish to use.
2. Connect the modified 5V power adapter to a power lead from your PC power supply (you will have to open your computer case).
3. Connect the serial cable to the DB-9 connector on the back of the display.
4. Connect the 5V power adapter to the 4-pin connector on the back of the display.

WARNING DO NOT use the standard floppy drive power connector, as this will not provide you with the correct voltage and will damage the display module.

Figure 13: PC vs Matrix Orbital Display Module Wiring

1.5 Installing the Software

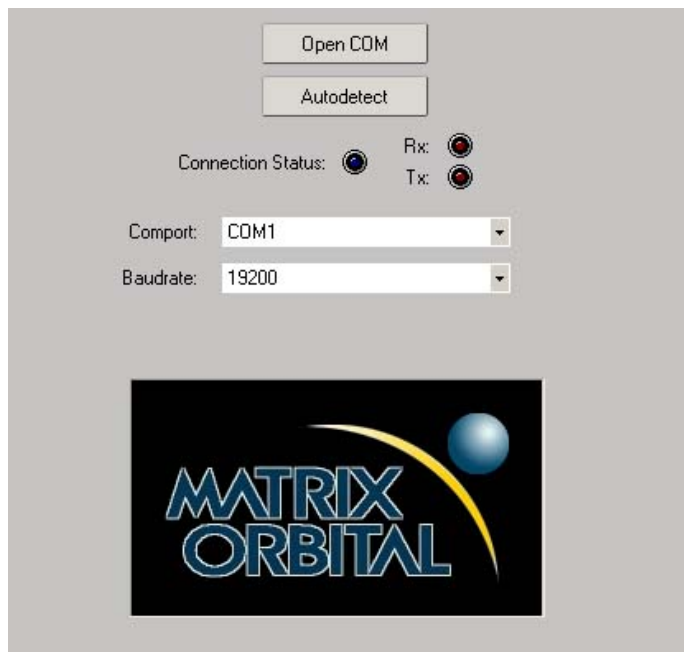

1.5.1 uProject

uProject was designed by Matrix Orbital to provide a simple and easy to use interface that will allow you to test all of the features of our alpha numeric displays.

To install uProject from the Matrix Orbital CD, follow the following steps:

1. Insert the Matrix Orbital CD-ROM into the CD drive
2. Locate the file, *uProject.exe*, which should be in the “CD-drive:\Download” directory.
3. Copy *uProject.exe* to a directory that you wish to run it from.
4. Double click on "uProject.exe"

Be sure to check the information selected in the COM Setup the first time uProject is run. Once this information is entered correctly the program can be used to control all functions of the graphic display.

Comport The serial port the display is plugged in to.
Baudrate The communication speed the display module is set to. (Default 19,200)

Figure 14: uProject Settings

NOTES

- uProject and other alphanumeric software may also be downloaded from Matrix Orbital's support site at http://www.matrixorbital.ca/software/software_alpha/

2 Hardware Information

Refer to the following diagram for this chapter:

Figure 15: VK202-25

2.1 DB-9 Connector

The VK202-25 provides a *DB-9 Connector* to readily interface with serial devices which use the EIA232 standard signal levels of $\pm 12V$ to $\pm 12V$. It is also possible to communicate at TTL levels of 0 to +5V by setting the *Protocol Select Jumpers* to TTL. As an added feature it is also possible to apply power through pin 9 of the *DB-9 Connector* in order to reduce cable clutter. However, in order to accomplish this you must set the *Power Through DB-9 Jumper*.

- | | |
|--------------|---|
| Pin 2 | Rx \ SCL (I^2C clock) |
| Pin 3 | Tx \ SDA (I^2C data) |
| Pin 5 | GND |
| Pin 9 | PWR (Must solder Power Through DB-9 Jumper. See table 1 on page 11 for power requirements.) |

Figure 16: RS-232 Pin out

2.1.1 Power Through DB-9 Jumper

In order to provide power through pin 9 of the *DB-9 Connector* you must place a solder jumper on the *Power through DB-9 Jumper* pictured in *figure 17* below. The VK202-25 allows all voltage models to use the power through DB-9 option, see table 1 on the following page for display module voltage requirements.

Figure 17: Power Through DB-9 Jumper

WARNING Do not apply voltage through pin 9 of the DB-9 connector AND through the Power/Data Connector at the same time.

2.2 Power/Data Connector

The *Power/Data Connector* provides a standard connector for powering the display module. The VK202-25 requires five volts for the standard display module, between nine to fifteen for the wide voltage (V) and between nine to thirty-five volts for the wide voltage with efficient power supply module (VPT). The voltage is applied through pins one and four of the four pin *Power/Data connector*. Pins two and three are reserved for serial transmission, using either the RS-232/TTL or the I²C protocol, depending on what has been selected by the *Protocol Select Jumpers*. Pins two and three may be reversed by changing the *Legacy Connector Jumpers* in order to be compatible with previous PCB revisions.

- Pin 1** PWR (See table 1)
- Pin 2** Rx \ SCL (I²C clock)
- Pin 3** Tx \ SDA (I²C data)
- Pin 4** GND

Figure 18: Power Connector and Pin out

Table 1: Power Requirements

	Standard	-V	-VPT
Supply Voltage	+5Vdc ±0.25V	+9V to +15V	+9V to +35V
Supply Current	148 mA typical		
Inrush	250 mA		

WARNINGS

- Do not apply any power with reversed polarization.
- Do not apply any voltage other than the specified voltage.

2.3 Protocol Select Jumpers

The *Protocol Select Jumpers*, pictured below in *figure 19*, provide the means necessary to toggle the display module between RS-232, TTL and I²C protocols. As a default, the jumpers are set to RS-232 mode with solder jumps on the 232 jumpers. In order to place the display module in I²C mode you must first remove the solder jumps from the 232 jumpers and then place them on the I2C jumpers. The display will now be in I²C mode and have a default slave address of 0x50 unless it has been changed. Similarly, in order to change the display to TTL mode, simply remove the zero ohm resistors from the 232 or I²C jumpers and solder them to the TTL jumpers.

Figure 19: Protocol Select Jumpers

2.4 General Purpose Outputs

A unique feature of the VK202-25 is the ability to control relays and other external devices using a *General Purpose Output*, which can provide up to 20 mA of current and +5Vdc from the positive side of the GPO. This is limited by a 240 ohm resistor which is located directly above the positive pin as pictured below in *figure 23*. If the device, which is being driven by a GPO, requires a relatively high current (such as a relay) and has an internal resistance of its own greater than 250 ohms, then the 240 ohm resistor may be removed and replaced with a Jumper.

Figure 20: General Purpose Output

WARNING If connecting a relay, be sure that it is fully clamped using a diode and capacitor in order to absorb any electro-motive force (EMF) which will be generated.

2.5 Dallas 1-Wire Bridge

In addition to the six general purpose outputs the VK202-25 offers a Dallas 1-wire bridge, to allow for an additional thirty two 1-wire devices to be connected to the display. Please note that the display normally does not come with the Dallas 1-wire bridge. It will have to be ordered as a custom. Please talk to your sales representative if you would like this option. See *Section 8 on page 32*.

Figure 21: Dallas 1-Wire Bridge

NOTE This component is optional and must be custom ordered

2.6 Manual Override

The *Manual Override* is provided to allow the VK202-25 to be reset to factory defaults. This can be particularly helpful if the display module has been set to an unknown baud rate or I²C Slave Address and you are no longer able to communicate with it. If you wish to return the module to its default settings you must:

1. Power off the display module.
2. Place a Jumper on the *Manual Override* pins.
3. Power up the display module.
4. The display module is now set to its default values listed below in *table 2*.
5. Edit and save settings.

Figure 22: Manual Override Jumper

Table 2: Default Values

Brightness	0x03
Baud Rate	19.2 kbps
I²C Slave Address	0x50
Data Lock	False
RS232AutoTransmitData	True

NOTE The display module will revert back to the old settings once turned off, unless the settings are saved.

2.7 Keypad Interface Connector

The VK202-25 provides a *Keypad Interface Connector* which allows for up to a five by five matrix style keypad to be directly connected to the display module. Key presses are generated when a short is detected between a row and a column. When a key press is generated a character, which is associated with the particular key press, is automatically sent on the Tx communication line. If the display module is running in I²C mode, the “Auto Transmit Keypress” function may be turned off, to allow the key presses to remain in the buffer so that they may be polled. The character that is associated with each key press may also be altered using the “Assign Key Codes” command, for more detailed information see the *Keypad Section, on page 34*.

Figure 23: Keypad Interface Connector

3 Troubleshooting

3.1 The display does not turn on when power is applied.

- First, you will want to make sure that you are using the correct power connector. Standard floppy drive power cables from your PC power supply may fit on the Power/Data Connector however they do not have the correct pin out as can be seen in *figure 13 on page 7*. Matrix Orbital supplies power cable adapters for connecting to a PC, which can be found in the *Accessories Section on page 2*.
- The next step is to check the power cable which you are using for continuity. If you don't have an ohm meter, try using a different power cable, if this does not help try using a different power supply.
- The last step will be to check the *Power / Data Connector* on the VK202-25. If the *Power / Data Connector* has become loose, or you are unable to resolve the issue, please contact Matrix Orbital, see *14.5 on page 54* for contact information.

3.2 The display module is not communicating.

- First, check the communication cable for continuity. If you don't have an ohm meter, try using a different communication cable. If you are using a PC try using a different Com Port.
- Second, please ensure that the display module is set to communicate on the protocol that you are using, by checking the *Protocol Select Jumpers*. To change the protocol used by the display module see *Section 2.3 on page 11*.
- Third, ensure that the host system and display module are both communicating on the same baud rate. The default baud rate for the display module is 19200 bps.
- If you are communicating to the display via I²C please ensure that the data is being sent to the correct address. The default slave address for the display module is 0x50.

NOTE I²C communication will always require pull up resistors.

- Finally, you may reset the display to it's default settings using the *Manual Override Jumper*, see *Section 2.6 on page 13*.

3.3 The display module is communicating, however text cannot be displayed.

- A common cause may be that the brightness settings have been set to low. The solution to this problem is to increase the brightness.

4 Communications

4.1 Introduction

The commands listed in this chapter describe how to configure data flow on the RS232/TTL and I²C port.

4.1.1 I²C Communication Summary

The VK202-25 is capable of communicating at 100 Kbps in I²C mode, with 127 units addressable on a single I²C communication line. However, in order to communicate via I²C you must first set the Protocol Select Jumpers as can be seen in *Section 2.3* and ensure that pull up resistors, with a nominal value of 1K to 10K, are placed on the SCL and SDA communication lines coming from pins two and three of the Data / Power Connector respectively. These pins are shared with RS232 and must be switched to I²C if this is how the host will be communicating with the display. Data responses by the module are automatically output via RS232, in case the host will be querying the module, it is necessary for the host to inform the module that its responses are to be output via I²C. This can be done by sending command 254 / 160 / 0 to turn off auto transmission of data in RS232. This will keep the data in the buffer until the master clocks a read of the slave. The I²C data lines operate at 5V. The VK202-25 uses 8-bit addressing, with the 8th or Least Significant Bit (LSB) bit designated as the read/write bit, a 0 designates a write address and a 1 designates a read address. The default read address of the display module will be 0x51, whereas the write address is 0x50 by default. This address may be changed by using cmd 254 / 51 / <address>. The VK202-25 should only be sent addresses that are even (LSB is 0). When the I²C master wishes to write to the display, the effective address is \$50 (0101 0000) , since the LSB has to be 0 for an I²C master write. When the I²C master wishes to read the VK202-25, the effective address is \$51 (0101 0001), since the LSB has to be 1 for an I²C master read.

If we take a standard Phillips 7 bit address of \$45 (100 0101), Matrix Orbital's VK202-25 would describe this Phillips I²C address as \$8A (1000 1010). The read address would be \$8B (1000 1011).

The unit does not respond to general call address (\$00).

When communicating in I²C the VK202-25 will send an ACK on the 9th clock cycle when addressed.

When writing to the display module, the display will respond with a ACK when the write has successfully been completed. However if the buffer has been filled, or the module is too busy processing data it will respond with a NAK. When performing a multiple byte read within one I²C transaction, each byte read from the slave should be followed by an ACK to indicate that the master still needs data, and a NAK to indicate that the transmission is over.

The VK202-25 has some speed limitations, especially when run in I2C mode. Here are some considerations when writing I2C code:

- * to be able to read the replies of query commands (eg. cmds 54, 55) the following command must be sent (only needs to be sent once, so this can be done somewhere in init): 254 / 160 / 0 this command puts the reply data in the I2C output buffer instead of the RS232 output buffer. Please note that due to a 16 byte output buffer, query commands that reply with more than 16 bytes cannot be read (eg cmd Get FileSystem Directory)

- * 3ms delay between the read commands

- * 625us delay in between data bytes within a transaction is necessary

- * 375us between transactions is necessary

Because of the considerable amount of delays necessary for I2C, it is suggested that the users explore the possibility of using other built in graphic commands to clear areas of the display when refreshing all or part of the display. For example, instead of sending the clear screen command, consider sending a rectangle command with the proper size, this is much faster than clearing everything and re-drawing or writing spaces over the area.

4.1.2 Serial Communication

In addition to being able to communicate via I²C the VK202-25 communicates natively through the RS-232 protocol at a default baud rate of 19,200 bps and is capable of standard baud rates from 9600 to 115,200 bps. Furthermore the VK202-25 is also capable of reproducing any non-standard baud rate in between using values entered into our baud rate generation algorithm and set through command 164 (0xA4). The display module communicates at standard voltage levels of $\pm 30V$ to $\pm 30V$ or at TTL levels of 0 to +5V by setting the *Protocol Select Jumpers* to TTL.

4.2 Changing the I²C Slave Address

Syntax	Hexadecimal	0xFE 0x33 [adr]	
	Decimal	254 51 [adr]	
	ASCII	254 "3" [adr]	
Parameters	Parameter	Length	Description
	adr	1	The new I ² C write address (0x00 - 0xFF).

Description This command sets the I²C write address of the module between 0x00 and 0xFF. The I²C write address must be an even number and the read address is automatically set to one higher. For example if the I²C write address is set to 0x50, then the read address is 0x51.

NOTE The change in address is immediate.

Remembered Always
Default 0x50

4.3 Changing the Baud Rate

Syntax Hexadecimal 0xFE 0x39 [speed]
Decimal 254 57 [speed]
ASCII 254 “9” [speed]

Parameters

Parameter	Length	Description
speed	1	Hex value corresponding to a baud rate.

Description This command sets the RS-232 port to the specified [speed]. The change takes place immediately. [speed] is a single byte specifying the desired port speed. Valid speeds are shown in the table below. The display module can be manually reset to 19,200 baud in the event of an error during transmission, including transmitting a value not listed below, by setting the manual override jumper during power up. However, it should be noted that this command will be ignored until the manual override jumper is removed again.

Hex Value	Baud Rate
53	1200
29	2400
CF	4800
67	9600
33	19200
22	28800
19	38400
10	57600

NOTE This command is not available in I2C mode.

Remembered Always
Default 19,200 bps

4.4 Setting a Non-Standard Baud Rate

Syntax	Hexadecimal	0xFE 0xA4 [speed]	
	Decimal	254 164 [speed]	
Parameters	Parameter	Length	Description
	speed	2	Inputed LSB MSB from baud rate formula (12-2047).
Description	This command sets the RS-232 port to a non-standard baud rate. The command accepts a two byte parameter that goes directly into the modules baud generator. Use the formula, $speed = \frac{CrystalSpeed}{8 \times DesiredBaud} - 1$ to calculate the [speed] for any baud rate setting. The speed can be anywhere from 12 to 2047 which corresponds to a baud range of 977 to 153,800 baud. Setting the baud rate out of this range could cause the display to stop working properly and require the Manual Override jumper to be set.		
Remembered	Always		

Examples

Crystal Speed 16 Mhz

Desired BAUD 13,500

$$speed = \frac{crystalspeed}{8 * DesiredBaud} - 1 \quad speed = \frac{16,000,000}{8 * 13,500} - 1$$

$$speed = 147.15 - 1$$

$$speed = 147.15$$

- **LSB** = 0x93 (rounded)
- **MSB** = 0x00
- **Intended Baud Rate:** 13,500 baud **Actual Baud Rate:**
 $\frac{16,000,000}{8(147+1)} = 13,514$ **Percent Difference:** 0.1%

NOTES

- Results from the formula are rounded down to the nearest whole number (i.e 73.07 = 73).
 - This formula becomes less accurate as baud rates increase, due to rounding.
 - Place the speed result backwards into the formula to receive the actual baud rate.
($Baud = \frac{CrystalSpeed}{8(speed+1)}$)
 - The actual baud rate must be within 3% of the intended baud rate for the device to communicate.
 - This command is not available in I2C mode.
-

5 Text

5.1 Introduction

The VK202-25 is an intelligent display module, designed to reduce the amount of code necessary to begin displaying data. This means that it is able to display all characters and strings that are sent to it, which are defined in the current character set. The display module will begin displaying text at the top left corner of the display area, known as home, and continue to print to the display as if it was a page on a typewriter. When the text reaches the bottom right row, it is able to automatically scroll all of the lines up and continue to display text, with the auto scroll option set to on.

5.1.1 Character Set

Figure 24: Character Set

5.1.2 Control Characters

0x08 Backspace

0x0C Clear screen / New page

0x0D Carriage return

0x0A Line feed / New line

5.2 Auto Scroll On

Syntax	Hexadecimal	0xFE 0x51
	Decimal	254 81
	ASCII	254 "Q"
Description	When auto scrolling is on, it causes the display to shift the entire display's contents up to make room for a new line of text when the text reaches the end of the last row.	
Remembered	Yes	
Default	On	

5.3 Auto Scroll Off

Syntax	Hexadecimal	0xFE 0x52
	Decimal	254 82
	ASCII	254 "R"

Description When auto scrolling is disabled the text will wrap to the top left corner of the display area when the text reaches the end of last row.

Remembered Yes

5.4 Clear Screen

Syntax Hexadecimal 0xFE 0x58
Decimal 254 88
ASCII 254 "X"

Description This command will immediately clear all of the contents of the display.

Remembered No

5.5 Changing the Startup Screen

Syntax Hexadecimal 0xFE 0x40 [chars]
Decimal 254 64 [chars]
ASCII 254 "@" [chars]

Parameter	Length	Description
chars	80	Characters to display for the startup screen.

Description In order to change the text that is displayed by the VK202-25 when it starts up simply send the command bytes 254 64 followed by the characters that you wish to display, starting from the top left. This command will automatically line wrap the characters that are sent to it.

Remembered Yes

5.6 Set Auto Line Wrap On

Syntax Hexadecimal 0xFE 0x43
Decimal 254 67
ASCII 254 "C"

Description Enabling Auto Line Wrap will allow the cursor to automatically wrap over to the next line when the current line is full.

NOTE Line wraps may occur in the middle of a word.

Remembered Yes

5.7 Set Auto Line Wrap Off

Syntax	Hexadecimal	0xFE 0x44
	Decimal	254 68
	ASCII	254 “D”
Description	Disabling Auto Line Wrap will allow you to have full control over the cursor position. This means that once the cursor has advanced to the end of a line, it will not wrap over to the next line, unless given the 'Set Cursor Position' Command.	

NOTE All characters written to the display past the end of a line will be lost.

Remembered Yes

5.8 Set Cursor Position

Syntax	Hexadecimal	0xFE 0x47 [col] [row]	
	Decimal	254 71 [col] [row]	
	ASCII	254 “G” [col] [row]	
Parameters	Parameter	Length	Description
	col	1	Column
	row	1	Row
Description	This command will allow you to manually set the cursor position, which controls the text insertion point, by specifying the [col] and [row] of the new proposed cursor position.		

NOTE If the cursor position is set past the end of a line it will wrap to the beginning of the next line.

Remembered No

5.9 Go Home

Syntax	Hexadecimal	0xFE 0x48
	Decimal	254 72
	ASCII	254 “H”
Description	This command will return the cursor to the top left corner of the display area, identified as row one, column one.	
Remembered	No	

5.10 Move Cursor Back

Syntax	Hexadecimal	0xFE 0x4C
	Decimal	254 76
	ASCII	254 "L"
Description	This command will move the cursor back one space. If this command is sent when the cursor is at the home position the cursor will wrap to the last row / column position if line wrap is on. Sending this command will not effect the text displayed on the module, however any characters that are sent will over write the current characters that are being displayed.	
Remembered	No	

5.11 Move Cursor Forward

Syntax	Hexadecimal	0xFE 0x4D
	Decimal	254 77
	ASCII	254 "M"
Description	This command will move the cursor forward one space. If this command is sent when the cursor is at the bottom right position the cursor will wrap back to the home position if line wrap is on. Sending this command will not effect the text displayed on the module, however any characters that are sent will over write the current characters that are being displayed.	
Remembered	No	

5.12 Underline Cursor On

Syntax	Hexadecimal	0xFE 0x4A
	Decimal	254 74
	ASCII	254 "J"
Description	This command will cause the VK202-25 to display an underline cursor at the current text insertion point.	
Remembered	Yes	

5.13 Underline Cursor Off

Syntax	Hexadecimal	0xFE 0x4B
	Decimal	254 75
	ASCII	254 “K”
Description	This command will turn the the underline cursor off.	
Remembered	Yes	

5.14 Blinking Block Cursor On

Syntax	Hexadecimal	0xFE 0x53
	Decimal	254 83
	ASCII	254 “S”
Description	This command will cause the VK202-25 to display an underline cursor at the current text insertion point.	
Remembered	Yes	

5.15 Blinking Block Cursor Off

Syntax	Hexadecimal	0xFE 0x54
	Decimal	254 84
	ASCII	254 “T”
Description	This command will turn the block cursor off.	
Remembered	Yes	

6 Special Characters

6.1 Introduction

6.2 Creating a Custom Character

Syntax	Hexadecimal	0xFE 0x4E [refID] [data]	
	Decimal	254 78 [refID] [data]	
	ASCII	254 “N” [refID] [data]	
Parameters	Parameter	Length	Description
	refID	1	Character reference ID (0-7).
	data	8	Character data.

Description The VK202-25 allows for up to eight custom defined characters to be added onto the the character set. A custom character is a five by seven, plus underline, pixel matrix with each row represented by a byte value. Eg.:

Custom Character 'h'					Decimal	Hex
1	0	0	0	0	16	0x10
1	0	0	0	0	16	0x10
1	0	0	0	0	16	0x10
1	0	1	1	0	22	0x16
1	1	0	0	1	25	0x19
1	0	0	0	1	17	0x11
1	0	0	0	1	17	0x11
0					0	0x00

Each bit value of one, in the table, represents an on pixel, whereas a value of zero represents a pixel that is turned off. Therefore in order to define custom character 'h' you would send the command byte prefix 254 followed by the command 78. Next, you will have to select the memory location in which you wish to save the character in. The available memory locations for this command are zero through to seven. After sending the memory location, or [refID], you may then send the eight byte custom character data in sequence from the top to the bottom.

Once you have defined a custom character you may display it by sending the display module the [refID]. For example if a custom character was saved in position one, the command to display the custom character, at the current cursor position, would be simply to send the number one to the display module without quotes.

Remembered No

6.3 Saving Custom Characters

Syntax	Hexadecimal	0xFE 0xC1 [Bank] [ID] [Data]	
	Decimal	254 193 [Bank] [ID] [Data]	
Parameters	Parameter	Length	Description
	Bank	1	Memory bank to save to (0-4).
	ID	1	Character ID (0-7)
	Data	8	Character Definition

Description New to the VK202-25 has added five non-volatile memory banks for custom character storage. This is intended to allow you to create your own custom bar graphs, medium/large numbers and startup screen. However, each memory bank may be used to store a set of any eight custom characters; with the only provision being that memory bank zero contains the characters that will be used in the startup screen. By default the memory banks will be loaded as follows:

[Bank]	Description
0	Startup screen characters.
1	Horizontal bars
2	Vertical bars
3	Medium numbers
4	Large numbers

In order to save new custom characters into a memory bank, follow the same process as you would for creating a custom character, see Section 6.2 on page 25, only use 254 193 [Bank Number] before sending the [ID] and character [Data].

Remembered Yes

6.4 Loading Custom Characters

Syntax Hexadecimal 0xFE 0xC0 [Bank]
 Decimal 254 192 [Bank]

Parameter	Length	Description
Bank	1	Memory bank to save to (0-4).

Description This command is used to load the custom characters into the volatile memory so that they may be used. If custom bar graph or number characters are stored in the memory banks, this command may be used instead of initializing the bar graph / number. To use this command send the command bytes followed by the [Bank] that contains the custom character data that you want to retrieve.

Remembered No

6.5 Save Startup Screen Custom Characters

Syntax Hexadecimal 0xFE 0xC2 [refID] [data]
 Decimal 254 194 [refID] [data]

Parameter	Length	Description
refID	1	Character reference ID (0-7).
data	8	Character data.

Description Using this command you may create the custom characters. that will be stored in memory bank zero, which will be used in the startup screen. For more information about creating custom characters see **Section 6.2 on page 25**.

NOTES

- Changes only take place once the power has been cycled.
- This command is the same as sending CMD 254 / 193 / 0 / [ID] / [DATA]

Remembered Yes

6.6 Initialize Medium Number

Syntax Hexadecimal 0xFE 0x6D
Decimal 254 109
ASCII 254 "m"

Description This command will load the default medium number characters into the volatile memory. If you have stored your own custom medium numbers, use the 'Load Custom Characters' command to load your custom character data into the volatile memory. This command will allow you to use the 'Place Medium Numbers' command.

Remembered No

6.7 Place Medium Numbers

Syntax Hexadecimal 0xFE 0x6F [Row] [Col] [Digit]
Decimal 254 111 [Row] [Col] [Digit]
ASCII 254 "o" [Row] [Col] [Digit]

Parameter	Length	Description
Row	1	The row number.
Col	1	The column number.
Digit	1	Medium number to place (0-9).

Description This command will place a medium number (two columns high) at the [row] and [col] specified.

Remembered No

6.8 Initialize Horizontal Bar

Syntax	Hexadecimal	0xFE 0x68
	Decimal	254 104
	ASCII	254 "h"
Description	This command will load the default horizontal bar characters into the volatile memory. If you have stored your own custom horizontal bar data, use the 'Load Custom Characters' command instead to load your custom bar data into the volatile memory. This command will allow you to use the 'Place Horizontal Bar' command.	
Remembered	No	

6.9 Place Horizontal Bar Graph

Syntax	Hexadecimal	0xFE 0x7C [Col] [Row] [Dir] [Length]	
	Decimal	254 124 [Col] [Row] [Dir] [Length]	
	ASCII	254 "j" [Col] [Row] [Dir] [Length]	
Parameters	Parameter	Length	Description
	Col	1	The column number.
	Row	1	The row number.
	Dir	1	The direction of the bar data (0 or 1).
	Length	1	The length of the bar data.
Description	This command will place a bar graph at [row], [column]. A [Dir] value of zero will cause the bar to go right, and one will cause the bar to go left. The [Length] is the size in pixels of the bar graph.		
<hr/>			
NOTE Bar graphs may be one directional only.			
<hr/>			
Remembered	No		

6.10 Initialize Narrow Vertical Bar

Syntax	Hexadecimal	0xFE 0x73
	Decimal	254 115
	ASCII	254 "s"

Description This command will load the narrow vertical bar characters into the volatile memory. If you have stored your own custom vertical bar data, use the 'Load Custom Characters' command instead to load your custom bar data into the volatile memory. This command will allow you to use the 'Place Vertical Bar' command.

NOTE Narrow bars have a width of two pixels.

Remembered No

6.11 Initialize Wide Vertical Bar

Syntax Hexadecimal 0xFE 0x76
Decimal 254 118
ASCII 254 "v"

Description This command will load the wide vertical bar characters into the volatile memory. If you have stored your own custom vertical bar data, use the 'Load Custom Characters' command instead to load your custom bar data into the volatile memory. This command will allow you to use the 'Place Vertical Bar' command.

NOTE Wide bars have a width of five pixels.

Remembered No

6.12 Place Vertical Bar

Syntax Hexadecimal 0xFE 0x3D [Column] [Length]
Decimal 254 61 [Column] [Length]
ASCII 254 "=" [Column] [Length]

Parameter	Length	Description
Column	1	The column number.
Length	1	The length of the bar data.

Description This command will place a bar graph at the specified [Column] with the specified [Length]. The [Length] is the size in pixels of the bar graph.

NOTE Bar graphs may be one directional only.

Remembered No

7 General Purpose Output

7.1 Introduction

General purpose outputs allow you to connect devices, such as LEDs, to the VK202-25 and supply them with up to 20mA of current at 5V. The VK202-25 has 6 GPOs which are software controlled, with functions to turn them on/off and set the power state for the next startup.

7.2 General Purpose Output Off

Syntax	Hexadecimal	0xFE 0x56 [Num]	
	Decimal	254 86 [Num]	
	ASCII	254 "V" [Num]	
Parameters	Parameter	Length	Description
	Num	1	GPO number.
Description	This command turns OFF general purpose output [num].		

NOTE OFF means that the output is pulled high.

Remembered Yes

7.3 General Purpose Output On

Syntax	Hexadecimal	0xFE 0x57 [Num]	
	Decimal	254 87 [Num]	
	ASCII	254 "W" [Num]	
Parameters	Parameter	Length	Description
	Num	1	GPO number.
Description	This command turns ON general purpose output [num]. The standard GPO's on the VK202-25 output 20mA of current at 5V.		

NOTE ON means the output is pulled low.

Remembered Yes

7.4 Set Startup GPO state

Syntax	Hexadecimal	0xFE 0xC3 [Num] [state]	
	Decimal	254 195 [Num] [state]	
Parameters	Parameter	Length	Description
	Num	1	GPO number.
	state	1	Startup state (0: Off, 1: On)
Description	This command will set the startup state for the GPO on the next power up. A value of one will cause the GPO to be off on the next startup while a value of one will cause the GPO to be on.		

NOTE This command does not affect the current state of the GPO.

Remembered Always

8 Dallas 1-Wire

8.1 Introduction

Another convenient feature of the VK202-25 is that it provides a Dallas 1-wire interface in order to readily communicate with up to thirty two 1-wire devices on a single bus. 1-wire communication is begun by discovering the address of the device that you wish to communicate with. To do this you must send the “Search for a 1-Wire Device” command. After you have established the address of the device that you wish to communicate with, you may begin a transaction with the device

8.2 Search for a 1-Wire Device

Syntax	Hexadecimal	0xFE 0xC8 0x2	
	Decimal	254 200 2	

Description

This command will allow you to begin communicating with the devices on the 1-wire bus by returning a packet containing device information for each 1-wire device on the bus in the form of:

Search Return Packet

Offset (Bytes)	Offset (Bytes)	Description
0	2	0x232A Preamble
2	1	0x8A Packet is 10 bytes long, another address will follow 0x0A Packet is 10 bytes long, this is the last address
3	1	0x31 - 1-Wire Packet Type
4	1	Error Code (0x00 for success)
5	8	1-Wire Address
13	1	CRC8 0x00 means the last address was valid

Remembered

No

8.3 Dallas 1-Wire Transaction

Syntax

Hexadecimal 0xFE 0xC8 0x1 [flags] [SndBits] [RcvBits] [Data]
Decimal 254 200 1 [flags] [SndBits] [RcvBits] [Data]

Parameters

Parameter	Length	Description
flags	1	Flags to control optional components of the transaction.
SndBits	1	The number of bits you will be transmitting on the bus.
RcvBits	1	The number of bits you will be reading on the bus.
Data	variable	Data to be transmitted, LSB to MSB.

Description This command will perform a single transaction on the 1-wire bus in this order:

1. Bus Reset.
2. Transmit data onto the bus.
3. Receive data from the bus.

The number of bits to be transmitted and read must be specified for this command to be successful.

NOTE To determine what functions the device will respond to, consult the devices' data sheet.

1-Wire Flags

Bit	Description
7	
6	Unused
5	(0 for future compatibility)
4	
3	Add a CRC8 to the end of the transmitted data
2	(0 for future compatibility)
1	Assume last received byte is a CRC8 and validate it
0	Reset bus before transaction

1-Wire Error Codes

Code	Description
0x00	Success
0x01	Unknown 1-Wire Command
0x02	No devices on the bus
0x03	Fatal search error

Remembered No

9 Keypad

9.1 Introduction

The VK202-25 supports up to a 25 key, matrix style, keypad and may be configured to allow key presses to be automatically transmitted via RS-232 or polled through I²C. The VK202-25 also allows for auto-repeating key presses, and remapping of all keypad character codes.

The connector is not keyed so the keypad will probably plug in either of two ways. The display will not be damaged by reversing the connector. However, the keypad will generate a different ASCII character mapping for each position. If the connector has fewer than 10 pins it should be centered on the display

connector. The keypad is scanned whenever a key is pressed; there is no continuous key scan. This means that key presses are dealt with immediately without any appreciable latency. This also prevents electrical noise which is often caused by continuous key scans.

NOTE Please note that keypads may be laid out in a different pattern. If this is the case, the user will need to interpret the key codes differently. Also included are two extra pins on each end of the connector to be used for ground strapping. This can be used in conjunction with your keypad if a ground strap connection is required or if a common ground connection is needed.

9.1.1 I2C Interface

The keypad is read by I2C master read. In short, this means that a read of the module will always return the first unread key press. A read is initiated by writing to the module with its base address plus 1, then clocking the module's return byte after the module releases the SDA line. Much more detail on this basic I2C function can be found in the I2C specification by Phillips.

9.1.2 RS232 Interface

By default on any press of a key, the module will immediately send out the key code at the selected baud rate. This behavior can be modified using commands found in the next section.

9.2 Auto Transmit Key Presses On

Syntax	Hexadecimal	0xFE 0x41
	Decimal	254 65
	ASCII	254 "A"
Description	In this mode, all key presses are sent immediately to the host system without the use of the poll keypad command. This is the default mode on power up.	

NOTE This command is not available in I2C.

Remembered	Yes
Default	On

9.3 Auto Transmit Key Presses Off

Syntax	Hexadecimal	0xFE 0x4F
	Decimal	254 79
	ASCII	254 “O”
Description	In this mode, up to 10 key presses are buffered until the unit is polled by the host system, via the poll keypad command 254 38. Issuing this command places the unit in polled mode.	

NOTE This command is not available in I2C.

Remembered Yes

9.4 Poll Key Press

Syntax	Hexadecimal	0xFE 0x26
	Decimal	254 38
	ASCII	254 “&”
Description	This command returns any buffered key presses via the RS-232 interface. The host system must be set up to receive key codes. When the display receives this command, it will immediately return any buffered key presses which may have not been read already. If there is more than one key press buffered, then the high order bit (MSB) of the returned key code will be set (1). If this is the only buffered key press, then the MSB will be cleared (0). If there are no buffered key presses, then the returned code will be 0x00. Please note that to make use of this command, the “Auto Transmit Key Presses” mode should be off.	

NOTE This command is not available in I2C. To read keys in I2C mode, one just needs to address the module and read a byte. No preceding commands are necessary. If there are no keys pressed the read will result in a 0x00.

Remembered No

9.5 Clear Key Buffer

Syntax	Hexadecimal	0xFE 0x45
	Decimal	254 69
	ASCII	254 “E”

Description	This command clears any unread key presses. In a menu application, if the user presses a key which changes the menu context, any following key presses may be inaccurate and can be cleared out of the buffer between menu changes to prevent jumping around the menu tree. It may also be used, in effect, to reset the keypad in case the host application resets for whatever reason.
Remembered	No

9.6 Set Debounce Time

Syntax	Hexadecimal	0xFE 0x55 [time]	
	Decimal	254 85 [time]	
	ASCII	254 “U” [time]	
Parameters	Parameter	Length	Description
	time	1	Debounce time in increments of 6.554ms (0 - 255).
Description	This command sets the time between key press and key read. All key types with the exception of latched piezo switches will 'bounce' for a varying time, depending on their physical characteristics. The [time] value is in increments of 6.554ms. The default debounce time for the module is 8 (about 52ms), which is adequate for most membrane keypads.		
Remembered	Yes		
Default	8		

9.7 Set Auto Repeat Mode

Syntax	Hexadecimal	0xFE 0x7E [mode]	
	Decimal	254 126 [mode]	
	ASCII	254 “~” [mode]	
Parameters	Parameter	Length	Description
	mode	1	Auto Repeat Mode (0: Resend Key , 1: Key Up/Down)

Description	<p>Two auto repeat modes are available and are set via the same command:</p> <ul style="list-style-type: none"> • Resend Key Mode: 0x00 • Key Up/Down Mode: 0x01 <p>Resend Key Mode This mode is similar to the action of a keyboard on a PC. In this mode, when a key is held down, the key code is transmitted immediately followed by a 1/2 second delay. After this delay, key codes will be sent via the RS-232 interface at a rate of about 5 codes per second. This mode has no effect if polling or if using the I²C interface.</p> <p>Key Up/Down Mode This mode may be used when the typematic parameters of the “Resend Key Code” mode are unacceptable or if the unit is being operated in polled mode. The host system detects the press of a key and simulates an auto repeat inside the host system until the key release is detected. In this mode, when a key is held down, the key code is transmitted immediately and no other codes will be sent until the key is released. On the release of the key, the key release code transmitted will be a value equal to the key down code plus 20 hex.</p>
Remembered	Yes
Examples	When the key code associated with key 'P' (0x50) is pressed, the release code is 'p' (0x70). In RS-232 polled mode or via the I ² C, the “Key Down / Key Up” codes are used; however, the user should be careful of timing details. If the poll rate is slower than the simulated auto-repeat it is possible that polling for a key up code will be delayed long enough for an unwanted key repeat to be generated.

9.8 Auto Repeat Mode Off

Syntax	Hexadecimal 0xFE 0x60 Decimal 254 96 ASCII 254 “”
Description	This command turns auto repeat mode off. See Set Auto Repeat Mode.
Remembered	No

9.9 Assign Keypad Codes

Syntax	Hexadecimal 0xFE 0xD5 [KDown] [KUp] Decimal 254 213 [KDown] [KUp]
--------	--

Parameters	Parameter	Length	Description																																																																																			
	KDown	16	Key down codes																																																																																			
	KUp	16	Key up codes																																																																																			
Description	This command will allow you to reassign the key codes that correspond to the key presses on the matrix style key pad. The first 25 bytes that are transmitted will be used for the key down codes and the next 25 bytes that are transmitted will be used for the key up codes.																																																																																					
	<table border="1"> <thead> <tr> <th colspan="5">Key Down</th> <th colspan="5">Key Up</th> </tr> <tr> <th></th> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> <th></th> <th>1</th> <th>2</th> <th>3</th> <th>4</th> <th>5</th> </tr> </thead> <tbody> <tr> <td>1</td> <td>A</td> <td>B</td> <td>C</td> <td>D</td> <td>E</td> <td>1</td> <td>a</td> <td>b</td> <td>c</td> <td>d</td> <td>e</td> </tr> <tr> <td>2</td> <td>F</td> <td>G</td> <td>H</td> <td>I</td> <td>J</td> <td>2</td> <td>f</td> <td>g</td> <td>h</td> <td>i</td> <td>j</td> </tr> <tr> <td>3</td> <td>K</td> <td>L</td> <td>M</td> <td>N</td> <td>O</td> <td>3</td> <td>k</td> <td>l</td> <td>m</td> <td>n</td> <td>o</td> </tr> <tr> <td>4</td> <td>P</td> <td>Q</td> <td>R</td> <td>S</td> <td>T</td> <td>4</td> <td>p</td> <td>q</td> <td>r</td> <td>s</td> <td>t</td> </tr> <tr> <td>5</td> <td>U</td> <td>V</td> <td>W</td> <td>X</td> <td>Y</td> <td>5</td> <td>u</td> <td>v</td> <td>w</td> <td>x</td> <td>y</td> </tr> </tbody> </table>				Key Down					Key Up						1	2	3	4	5		1	2	3	4	5	1	A	B	C	D	E	1	a	b	c	d	e	2	F	G	H	I	J	2	f	g	h	i	j	3	K	L	M	N	O	3	k	l	m	n	o	4	P	Q	R	S	T	4	p	q	r	s	t	5	U	V	W	X	Y	5	u	v	w	x	y

10 Display Functions

10.1 Introduction

The VK202-25 employs software controlled display settings, which allow for control over, clearing the screen, changing the brightness and contrast or setting timers for turning it on or off. The combination of these allow you complete software control over your display's appearance.

10.2 Display On

Syntax	Hexadecimal	0xFE 0x42 [min]	
	Decimal	254 66 [min]	
	ASCII	254 "B" [min]	
Parameters	Parameter	Length	Description
	min	1	Minutes before turning the display on (0 to 100).
Description	This command turns the display on after the [minutes] timer has expired, with a one-hundred minute maximum timer. A time of 0 specifies that the display should turn on immediately and stay on. When this command is sent while the remember function is on, the timer will reset and begin after power up.		
Remembered	Yes		
Default	0		

10.3 Display Off

Syntax	Hexadecimal	0xFE 0x46
	Decimal	254 70
	ASCII	254 "F"
Description	This command turns the display off immediately. The display will remain off until a 'Display On' command has been received.	
Remembered	Yes	

10.4 Set VFD Brightness

Syntax	Hexadecimal	0xFE 0x59 [brightness]					
	Decimal	254 89 [brightness]					
	ASCII	254 "Y" [brightness]					
Parameters	<table border="1"><thead><tr><th>Parameter</th><th>Length</th><th>Description</th></tr></thead><tbody><tr><td>brightness</td><td>1</td><td>Brightness setting (0 to 3).</td></tr></tbody></table>	Parameter	Length	Description	brightness	1	Brightness setting (0 to 3).
Parameter	Length	Description					
brightness	1	Brightness setting (0 to 3).					
Description	This command sets and saves the display's brightness to [brightness], where [brightness] is a value between 0x00 and 0x03 (between 0 and 3) according to the table below:						

Value	Brightness
0x00	0%
0x01	25%
0x01	50%
0x02	75%
0x03	100%

If the remember function is on, this command acts the same as 'Set and Save VFD Brightness'.

Remembered	Yes
Default	255

10.5 Set and Save VFD Brightness

Syntax	Hexadecimal	0xFE 0x91 [brightness]					
	Decimal	254 145 [brightness]					
Parameters	<table border="1"><thead><tr><th>Parameter</th><th>Length</th><th>Description</th></tr></thead><tbody><tr><td>brightness</td><td>1</td><td>Brightness setting (0 to 3).</td></tr></tbody></table>	Parameter	Length	Description	brightness	1	Brightness setting (0 to 3).
Parameter	Length	Description					
brightness	1	Brightness setting (0 to 3).					

Description This command sets and saves the display's brightness to [brightness], where [brightness] is a value between 0x00 and 0x03 (between 0 and 3) according to the table below:

Value	Brightness
0x01	25%
0x01	50%
0x02	75%
0x03	100%

Remembered Always

11 Data Security

11.1 Introduction

Ensuring that your VK202-25 display's exactly what you want it to can be the difference between a projects success and failure. This is why we incorporate features such as Data Lock into the VK202-25 With this new feature you now are in control over of how and when settings will be changed so there is no need to worry about the module acting exactly like you expected it to because all the settings may be locked and remembered for the next power up.

11.2 Set Remember

Syntax	Hexadecimal	0xFE 0x93 [switch]	
	Decimal	254 147 [switch]	
Parameters	Parameter	Length	Description
	switch	1	0: Do not remember, 1: Remember

Description This command allows you to switch the remember function on and off. To use the remember function, set remember to on, then set all of the settings that you wish to save, settings that are listed as 'Remember: Yes' support being saved into the non-volatile memory. After you have set all of the commands that you wish to save, you may then cycle the power and check the display settings to ensure that all the settings have been saved. If you wish to use remember again after cycling the power, you must set it to on again.

NOTES

- Writing to non-volatile memory is time consuming and slows down the operation of the display.
 - Non-volatile memory has a 'write limit' and may only be changed approximately 100,000 times.
-

Remembered No
 Default Do not remember

11.3 Data Lock

Syntax	Hexadecimal	0xFE 0xCA 0xF5 0xA0 [level]	
	Decimal	254 202 245 160 [level]	
Parameters	Parameter	Length	Description
	level	1	Sets the data lock level

Description

Data lock, originally known as paranoia, allows you to lock the module from displaying information, as well as enables the protection of the filesystem and module settings. Each bit corresponds to a different lock level, while sending a zero will unlock your display as the following tables explains:

Bit	Data Lock Level	Description
0-2	Reserved	Should be left 0
3	Communication Speed Lock	When this bit is set (1) the Baud Rate and I2C Slave address are locked
4	Setting Lock	When this bit is set (1) the display settings such as backlight, contrast and GPO settings are locked. (Internal EEPROM)
5	Filesystem Lock	When this bit is set (1) the external EEPROM is locked, this has the same effect as the File System Jumper
6	Command Lock	When this bit is set (1) all commands but commands 202/203 are locked. (cmd lock)
7	Display Lock	When this bit is set (1) the module is locked from displaying any new information. (text lock)

NOTES

- Sending a new data lock level will override the previous data lock level.
- Data lock levels may be combined.

Hex	Dec	Binary	Description
0x00	0	0	Unlock
0x50	80	01010000	Setting and Command Lock

11.4 Set and Save Data Lock

Syntax	Hexadecimal	0xFE 0xCB 0xF5 0xA0 [level]	
	Decimal	254 203 245 160 [level]	
Parameters	Parameter	Length	Description
	level	1	Sets the data lock level
Description	This command will set and save the data lock level. See the Data Lock section for more information.		
Remembered	Always		
Default	0		

11.5 Writes the Customer Data

Syntax	Hexadecimal	0xFE 0x34 [data]	
	Decimal	254 52 [data]	
	ASCII	254 "4" [data]	
Parameters	Parameter	Length	Description
	data	16	Writes the customer data
Description	Writes the customer Data. 16 Bytes of data can be saved in non-volatile memory.		
Remembered	No		

11.6 Reads the Customer Data

Syntax	Hexadecimal	0xFE 0x35
	Decimal	254 53
	ASCII	254 "5"
Description	Reads whatever was written by Write Customer Data.	
Remembered	No	

12 Miscellaneous

12.1 Introduction

This chapter covers the 'Report Version Number' and 'Read Module Type' commands. These commands can be particularly useful to find out more information about the display module before contacting technical support.

12.2 Read Version Number

Syntax	Hexadecimal	0xFE 0x36
	Decimal	254 54
	ASCII	254 "6"
Description	This command will return a byte representing the version of the module, see the following table as an example:	

Hex Value	Version Number
0x10	Version 1.0
0x20	Version 2.0
0x42	Version 4.2

Remembered No

12.3 Read Module Type

Syntax	Hexadecimal	0xFE 0x37
	Decimal	254 55
	ASCII	254 "7"

Description

This command will return a hex value corresponding to the the model number of the module see the following table:

Hex	Product ID	Hex	Product ID
1	LCD0821	36	LK202-24-USB
2	LCD2021	37	VK202-24-USB
5	LCD2041	38	LK204-24-USB
6	LCD4021	39	VK204-24-USB

13 Command Summary

13.1 Communications

Description	Syntax	Page
Changing the I ² C Slave Address	Hexadecimal	0xFE 0x33 [adr]
	Decimal	254 51 [adr]
	ASCII	254 "3" [adr]
Changing the Baud Rate	Hexadecimal	0xFE 0x39 [speed]
	Decimal	254 57 [speed]
	ASCII	254 "9" [speed]

Description	Syntax	Page
Setting a Non-Standard Baud Rate	Hexadecimal 0xFE 0xA4 [speed] Decimal 254 164 [speed]	19

13.2 Text

Description	Syntax	Page
Auto Scroll On	Hexadecimal 0xFE 0x51	21
	Decimal 254 81	
	ASCII 254 "Q"	
Auto Scroll Off	Hexadecimal 0xFE 0x52	21
	Decimal 254 82	
	ASCII 254 "R"	
Clear Screen	Hexadecimal 0xFE 0x58	22
	Decimal 254 88	
	ASCII 254 "X"	
Changing the Startup Screen	Hexadecimal 0xFE 0x40 [chars]	22
	Decimal 254 64 [chars]	
	ASCII 254 "@" [chars]	
Set Auto Line Wrap On	Hexadecimal 0xFE 0x43	22
	Decimal 254 67	
	ASCII 254 "C"	
Set Auto Line Wrap Off	Hexadecimal 0xFE 0x44	23

Description	Syntax		Page
Blinking Block Cursor Off	Hexadecimal	0xFE 0x54	25
	Decimal	254 84	
	ASCII	254 "T"	

13.3 Special Characters

Description	Syntax		Page
Creating a Custom Character	Hexadecimal	0xFE 0x4E [refID] [data]	25
	Decimal	254 78 [refID] [data]	
	ASCII	254 "N" [refID] [data]	
Saving Custom Characters	Hexadecimal	0xFE 0xC1 [Bank] [ID] [Data]	26
	Decimal	254 193 [Bank] [ID] [Data]	
Loading Custom Characters	Hexadecimal	0xFE 0xC0 [Bank]	27
	Decimal	254 192 [Bank]	
Save Startup Screen Custom Characters	Hexadecimal	0xFE 0xC2 [refID] [data]	27
	Decimal	254 194 [refID] [data]	
Initialize Medium Number	Hexadecimal	0xFE 0x6D	28
	Decimal	254 109	
	ASCII	254 "m"	
Place Medium Numbers	Hexadecimal	0xFE 0x6F [Row] [Col] [Digit]	28
	Decimal	254 111 [Row] [Col] [Digit]	
	ASCII	254 "o" [Row] [Col] [Digit]	
Initialize Horizontal Bar	Hexadecimal	0xFE 0x68	28
	Decimal	254 104	
	ASCII	254 "h"	
Place Horizontal Bar Graph	Hexadecimal	0xFE 0x7C [Col] [Row] [Dir] [Length]	29
	Decimal	254 124 [Col] [Row] [Dir] [Length]	
	ASCII	254 "j" [Col] [Row] [Dir] [Length]	
Initialize Narrow Vertical Bar	Hexadecimal	0xFE 0x73	29
	Decimal	254 115	
	ASCII	254 "s"	
Initialize Wide Vertical Bar	Hexadecimal	0xFE 0x76	30
	Decimal	254 118	
	ASCII	254 "v"	
Place Vertical Bar	Hexadecimal	0xFE 0x3D [Column] [Length]	30
	Decimal	254 61 [Column] [Length]	
	ASCII	254 "=" [Column] [Length]	

13.4 General Purpose Output

Description	Syntax	Page
General Purpose Output Off	Hexadecimal	0xFE 0x56 [Num]
	Decimal	254 86 [Num]
	ASCII	254 “V” [Num]
General Purpose Output On	Hexadecimal	0xFE 0x57 [Num]
	Decimal	254 87 [Num]
	ASCII	254 “W” [Num]
Set Startup GPO state	Hexadecimal	0xFE 0xC3 [Num] [state]
	Decimal	254 195 [Num] [state]

13.5 Dallas 1-Wire

Description	Syntax	Page
Search for a 1-Wire Device	Hexadecimal	0xFE 0xC8 0x2
Dallas 1-Wire Transaction	Decimal	254 200 2
	Hexadecimal	0xFE 0xC8 0x1 [flags] [SndBits] [RcvBits] [Data]
	Decimal	254 200 1 [flags] [SndBits] [RcvBits] [Data]

13.6 Keypad

Description	Syntax	Page
Auto Transmit Key Presses On	Hexadecimal	0xFE 0x41
	Decimal	254 65
	ASCII	254 “A”
Auto Transmit Key Presses Off	Hexadecimal	0xFE 0x4F
	Decimal	254 79
	ASCII	254 “O”
Poll Key Press	Hexadecimal	0xFE 0x26
	Decimal	254 38
	ASCII	254 “&”
Clear Key Buffer	Hexadecimal	0xFE 0x45
	Decimal	254 69
	ASCII	254 “E”
Set Debounce Time	Hexadecimal	0xFE 0x55 [time]
	Decimal	254 85 [time]
	ASCII	254 “U” [time]
Set Auto Repeat Mode	Hexadecimal	0xFE 0x7E [mode]
	Decimal	254 126 [mode]
	ASCII	254 “~” [mode]
Auto Repeat Mode Off	Hexadecimal	0xFE 0x60
	Decimal	254 96
	ASCII	254 “”
Assign Keypad Codes	Hexadecimal	0xFE 0xD5 [KDown] [KUp]
	Decimal	254 213 [KDown] [KUp]

13.7 Display Functions

Description	Syntax	Page	
Display On	Hexadecimal	0xFE 0x42 [min]	39
	Decimal	254 66 [min]	
	ASCII	254 "B" [min]	
Display Off	Hexadecimal	0xFE 0x46	40
	Decimal	254 70	
	ASCII	254 "F"	
Set VFD Brightness	Hexadecimal	0xFE 0x59 [brightness]	40
	Decimal	254 89 [brightness]	
	ASCII	254 "Y" [brightness]	
Set and Save VFD Brightness	Hexadecimal	0xFE 0x91 [brightness]	40
	Decimal	254 145 [brightness]	

13.8 Data Security

Description	Syntax	Page	
Set Remember	Hexadecimal	0xFE 0x93 [switch]	41
	Decimal	254 147 [switch]	
Data Lock	Hexadecimal	0xFE 0xCA 0xF5 0xA0 [level]	42
	Decimal	254 202 245 160 [level]	
Set and Save Data Lock	Hexadecimal	0xFE 0xCB 0xF5 0xA0 [level]	44
	Decimal	254 203 245 160 [level]	
Writes the Customer Data	Hexadecimal	0xFE 0x34 [data]	44
	Decimal	254 52 [data]	
	ASCII	254 "4" [data]	
Reads the Customer Data	Hexadecimal	0xFE 0x35	44
	Decimal	254 53	
	ASCII	254 "5"	

13.9 Miscellaneous

Description	Syntax	Page	
Read Version Number	Hexadecimal	0xFE 0x36	45
	Decimal	254 54	
	ASCII	254 "6"	
Read Module Type	Hexadecimal	0xFE 0x37	45
	Decimal	254 55	
	ASCII	254 "7"	

13.10 Command By Number

Command		Description		Page
Hex	Dec	ASCII		
0x26	38	"&"	Poll Key Press	36
0x33	51	"3"	Changing the I ² C Slave Address	17

14 Appendix

14.1 Specifications

14.1.1 Environmental

Table 65: Environmental Specifications

	Standard Temperature	Extended Temperature
Operating Temperature	-20°C to +70°C	-40°C to +85°C
Storage Temperature	-40°C to +80°C	-50°C to +85°C
Operating Relative Humidity	80% max non-condensing	
Vibration (Operating)	4.9 m/s ² XYZ directions	
Vibration (Non-Operating)	19.6 m/s ² XYZ directions	
Shock (Operating)	29.4 m/s ² XYZ directions	
Shock (Non-Operating)	593 m/s ² XYZ directions	

14.1.2 Electrical

Table 66: Electrical Specifications

	Standard	-V	-VPT
Supply Voltage	+5Vdc ±0.25V	+9V to +15V	+9V to +35V
Supply Current	148 mA typical		
Inrush	250 mA		

14.2 Physical Layout

14.3 Optical Characteristics

Table 67: Optical Characteristics

Number of Characters	40 (20 characters by 2 lines)
Matrix Format	5 x 7 with underline
Display Area	70.8
Character Size	2.4 x 4.7 mm (XxY)
Character Pitch	3.6 mm
Line Pitch	6.1 mm
Dot Size	0.4 x 0.5 mm (XxY)
Dot Pitch	0.5 x 0.7 mm (XxY)
Luminance	350cd/m ² (100fL) min
Color of Illumination	Blueish Green

14.4 Definitions

E Extended Temperature (-40C to 85C)

VPT Wide Voltage with Efficient Switching Power Supply (+9 to +35Vdc)

V Wide Voltage (+9 to +15Vdc)

MSB Most Significant Byte

LSB Least Significant Byte
