

**DESCRIPTION**

The LXMG1617A-03-2x™ is a Single Output 2.2W Direct Drive™ CCFL (Cold Cathode Fluorescent Lamp) Inverter Module designed for driving LCD backlight lamps. It is ideal for driving typical 3.9" to 6.4" TFT panels.

LXMG1617A modules provide the designer with a superior display brightness range. This brightness range is achievable with virtually any LCD display.

The maximum output current is externally programmable over a range of 3.5mA to 5mA in 0.5mA steps (PanelMatch) to allow the inverter to properly match to a wide array of LCD panel lamp current specifications. The modules include a dimming input that permits brightness control from a DC voltage source, a PWM signal or an external potentiometer.

The resultant "burst drive" that energizes the lamp was designed to ensure that no premature lamp degradation occurs, while allowing significant power savings at lower dim levels.

The modules convert DC voltage from the system battery or AC adapter directly to high frequency, high-voltage waves required to ignite and operate CCFL lamps. A 5V input inverter is also available (LXMG1617A-05-2x).

The LXMG1617A modules contain the newer highly integrated LX1691B CCFL backlight controller to provide wider dimming range (typically 100:1+) and wider temperature range (-30°C to 80°C) compared to the existing solutions offered by Microsemi.

Other benefits of the inverter's topology include stable fixed-frequency operation, secondary-side strike voltage regulation and both open/shorted lamp protection with fault timeout.

The new LXMG1617A ("A Series") modules are designed therefore as a higher performance near drop-in-replacement (see BRITE minimum input voltage level and Burst Frequency) for those customers and applications currently using the LXMG1617 inverters.

**KEY FEATURES**

- Externally Programmable Maximum Output Current
- Easy to Use Brightness Control
- Output Short-Circuit Protection and Automatic Strike-Voltage Regulation and Timeout
- RangeMAX Wide Range Dimming (typ. 100:1+)
- Rated From -30°C to 80°C
- UL60950 E175910
- RoHS Compliant

**APPLICATIONS**

- Medical Instrument Displays
- Portable Instrumentation (GPS, etc.)
- Industrial Display Controls

**BENEFITS**

- Smooth, Flicker Free Full-Range Brightness Control
- Programmable Output Current Allows Inverter to Mate with a Wide Variety of LCD Panel's Specifications
- Output Open Circuit Voltage Regulation Minimizes Corona Discharge For High Reliability

Exceeding these ratings could cause damage to the device. All voltages are with respect to ground. Currents are positive into, negative out of specified terminal.

**RECOMMENDED OPERATING CONDITIONS (R.C.)**

This module has been designed to operate over a wide range of input and output conditions. However, best efficiency and performance will be obtained if the module is operated under the condition listed in the 'R.C.' column. Min. and Max. columns indicate values beyond which the inverter, although operational, may not function optimally.

Parameter	Symbol	Recommended Operating Conditions			Units
		Min	R.C.	Max	
Input Supply Voltage Range (Fully Regulated Lamp Current)	$V_{IN}$	3	3.3	3.6	V
Input Supply Voltage Range (Functional)		3		4.2	
Output Power	$P_O$			2.2	W
Linear BRITE Control Input Voltage Range <sup>1</sup>	$V_{BRT\_ADJ}$	0		2.0	V
Lamp Operating Voltage	$V_{LAMP}$	325	380	435*	V <sub>RMS</sub>
Lamp Current (Full Brightness)	$I_{OLAMP}$	3.5		5.0 <sup>†</sup>	mA <sub>RMS</sub>
Operating Ambient Temperature Range	$T_A$	-30		80	°C

<sup>1</sup> The BRITE minimum input voltage level is 0V, whereas it is 0.5V in the original LXMG1617-03-2x inverter, see application info on page 5.

\*Total output power must not exceed 2.2W. Higher voltage lamps may require maximum output current to be set lower than 5mA<sub>RMS</sub>

<sup>†</sup>At input voltages below 3.6V the inverter may not be able to output the full 5mA<sub>RMS</sub> in all configurations.

(SET<sub>1</sub> and SET<sub>2</sub> Inputs)

- The brightness control may be a voltage output DAC or other voltage source, a digital pot or 500k manual pot. The inverter contains an internal 215k pull-up to 3V to bias the pot, it may be necessary to add a small value resistor in series with the ground side of the POT to set the lower threshold voltage above the absolute minimum dim level capability, especially when both SET pins are programmed low. A PWM logic level signal (figure 1A) may be used up to 5V; however the inverter will reach maximum current at less than 100% duty cycle. This can be calculated as approximately 2V divided by the logic high voltage level; with 3.3V logic level this corresponds to about 60% duty cycle for maximum lamp current.
- If you need to turn the inverter ON/OFF remotely, connect to TTL logic signal to the SLEEP input.
- Connect V<sub>HI</sub> to high voltage wire from the lamp. Connect V<sub>LO</sub> to the low voltage wire (wire with thinner insulation). Never connect V<sub>LO</sub> to circuit ground as this will defeat lamp current regulation. If both lamp wires have heavy high voltage insulation, connect the longest wire to V<sub>LO</sub>. This wire is typically white.
- Use the SET<sub>1</sub> and SET<sub>2</sub> (see Figure 2) inputs to select the desired maximum output current. Using these two pins in combination allows the inverter to match a wide variety of panels from different manufacturers. Generally the best lamp lifetime correlates with driving the CCFL at the manufacture's nominal current setting. However the SET<sub>1</sub> and SET<sub>2</sub> inputs allow the user the flexibility to adjust the current to the maximum allowable output current to increase panel brightness at the expense of some reduced lamp life.
- Although the SET pins are designed such that just leaving them open or grounding them is all that is needed to set the output current, they can also be actively set. Using an open collector or open drain logic signal will allow you to reduce the lamp current for situations where greater dim range is required, as an example in nighttime situations. In conjunction with a light sensor or other timer the panel could be set to higher brightness (maximum output current) for daytime illumination and lower brightness (minimum or typical output current) at nighttime. Since the dim ratio is a factor of both the burst duty cycle and the peak output current, using this technique the effective dim ratio can be increased greater than the burst duty cycle alone. Conversely, the SET inputs could be used to overdrive the lamp temporarily to facilitate faster lamp warm up at initial lamp turn on. Of course any possible degradation on lamp life from such practices is the user's responsibility since not all lamps are designed to be overdriven.
- The inverter has a built in fault timeout function. If the output is open (lamp disconnected or broken) or shorted the inverter will attempt to strike the lamp up to about one second, after which (without success) the inverter will shutdown, in this mode the inverter will draw about 8mA from V<sub>IN</sub>. In order to restart the inverter it is necessary to toggle the sleep input or cycle the V<sub>IN</sub> input supply.
