## Logic Control

Power fail:
Remote on/off:
DC-OK:
Remote sense:

TTL Logic signal goes high 50-150 msec after 5 V output. It goes low at least 4 ms before loss of regulation Requires an external contact (N.O or N.C) to inhibit outputs

TTL logic goes high 50-150 msec after the output. It goes low when there is loss of regulation.
Compensates for 0.5 V lead drop minimum, will operate without remote sense connected. Reverse connection protected

1. Peak current lasting < 30 seconds with a maximum $10 \%$ duty cycle.
2. At $25^{\circ} \mathrm{C}$ including initial tolerance, line voltage, load currents and output voltages adjusted to factory settings.
3. Peak-to-peak with 20 MHz bandwidth and $10 \mu \mathrm{~F}$ in parallel with a $0.1 \mu \mathrm{~F}$ capacitor at rated line voltage and load ranges.
4. 4th output 5-25 V factory set at 5 V .
5. Minimum Load is required.
6. If optional CF or CEF fans are not used, 30CFM forced air cooling needs to be provided and is required through the length of the power supply. Not convection rated.

Note: -CF suffix added to the model number indicates cover with top fan. -CEF suffix added to the model number indicates cover with dual end mounted fan cover and AC inlet.
