Logic Control

Remote ON/OFF (PSON#)

The PSON# signal is required to remotely turn on/off the power supply. PSON# is an active low signal that turns on the +12 Vdc power rail. When this signal is not pulled low by the system, or left open, the +12 Vdc output turns off. The 3.30 Vsb output remains on. This signal is pulled to a standby voltage by a pull-up resistor internal to the power supply. The power supply fan(s) shall operate at the lowest speed

Signal Type	Accepts an open collector/drain input from the system. Pulled-up to the 3.30 Vsb located in the power supply	
PSON# = Low	ON	
PSON# = Open	OFF	
	MIN	MAX
Logic level low (power supply ON)	0 V	0.8 V
Logic level high (power supply OFF)	2.0 V	4.125 V
Source Current, Vpson = low		4 mA
Power up delay: T _{pson on delay}	5 msec	400 msec

Table 1 PSON# Signal Characteristics

Power Good (PWOK#)

PWOK# is a power good signal and will be pulled **LOW** by the power supply to indicate that both the outputs are above the regulation limits of the power supply. When an output voltage falls below regulation limits or when AC power has been removed for a time sufficiently long so that power supply operation is no longer guaranteed, PWOK will be de-asserted to a **HIGH** state. The start of the PWOK# delay time shall be inhibited as long as the +12 Vdc output is in current limit or the 3.30 Vsb output is below the regulation limit.

Signal Type:	Open collector/drain output from power supply. Pull-up to 3.30Vsb external to the power supply	
PWOK = High	Power <i>not</i> good	
PWOK = Low	Power Good	
	MIN	MAX
Logic level low voltage, Isink = 4 mA	0 V	0.8 V
Logic level high voltage, Isource = 200 A	2.0 V	4.125 V
Sink current, PWOK = low		4 mA
Source current, PWOK = high		2 mA
PWOK delay: T _{pwok on}	100 ms	1000 ms
PWOK rise and fall time		100 sec
Power down delay: T _{pwok off}	1 ms	1000 msec

Table 2 PWOK# Signal Characteristics

Power Supply Present Indicator (PRESENT#)

The PRESENT# signal is primarily used to provide a mechanism by which the host system can sense the number of power supplies physically present (operational or not). This pin is connected to ground in the power supply.

AC Input Present Indicator (ACOK#)

The AC OK# signal is used to indicate presence of AC input to the power supply. This signal shall be connected to 3.3 Vsb through a resistor on the host system side. A logic "Low" level on this signal shall indicate AC input to the power supply is present. A Logic "High" on this signal shall indicate a loss of AC input to the power supply.

Signal Type	Pull-up to 3.30 Vsb through a resistor in the host system
PRESENT# = Low	Present
PRESENT# = High	Not Present
