

FNP1500/1800 front-ends have front-mounted AC input receptacles.

## Applications

- Telecommunications
- Data communications
- Servers
- Distributed power

## Features

- RoHS compliant for all six substances
- High density front-ends 15.2 to $18.3 \mathrm{~W} / \mathrm{in}^{3}$
- Wide input voltage range 85 to 264 VAC
- 12 V standby voltage, 1 A per front-end
- Highly efficient topology reduces operating costs
- $\quad I^{2} \mathrm{C}$ interface status and control
- $\quad I^{2} C$ voltage and current limit setting
- Analog output voltage setting
- Overtemperature, output overvoltage, and output overcurrent protection
- ORing circuits for true redundant operation: $\mathrm{V}_{\mathrm{o} 1}$ : ORing FETs; $\mathrm{V}_{\mathrm{o} 2}$ : ORing Diodes
- Status LEDs: AC OK, DC OK, and Fan Fail/Overtemperature Fail

FNR-3
Power Shelf

FNR-3 shelves provide up to 5400 watts in a 19" rack.
(See the Rack section for power shelf details.)

## Description

The FNP1500/1800 front-ends are power-factor-corrected (PFC) which (depending on model type) provide a 12 VDC or 48 VDC ( 1500 or 1800 watt) output, and can be used in hot-swap redundant systems. Their very small dimensions allow configuration of up to three units in a 1 U rack. The FNP front-ends have a front-mounted AC receptacle. The highly efficient thermal design with internal-fan cooling permits their use over wide temperature ranges and provides very high reliability.
Status information is provided with front panel LEDs, logic signals, and via an $I^{2} \mathrm{C}$ management interface. In addition, the $\mathrm{I}^{2} \mathrm{C}$ bus can enable the power supply, set high fan speed, adjust the output voltage, and set the output current limit. The FNP1500/1800's meet international safety standards and display the CE-Mark for the European Low Voltage Directive (LVD).

FNR-3-12G and FNR-3-48G power-shelf solutions provide rectification, system management, and power distribution, while maintaining high reliability and offering flexibility for future expansion. The power shelves can be configured with up to three hotswappable 1500 or 1800-watt AC-DC front-ends.

Changing the Shape of Power

## Safety Specifications

Maximum electric strength testing is performed in the factory according to EN 550116, IEC/EN 60950, and UL 60950. Input-to-output electric strength tests should not be repeated in the field. Power-One will not honor any warranty claims resulting from electric strength field tests.

| Parameter | Conditions/description | Min | Nom | Max | Unit |
| :--- | :---: | :---: | :---: | :---: | :---: |
| Agency approvals | UL60950, (UL) CSA 60950 (cUL), |  |  |  |  |
|  | EN 60950(TUU), CE Mark for LVD |  |  |  |  |

${ }^{1}$ Subassemblies are pre-tested with 4.2 kVDC in accordance with EN50116 and IEC/EN60950.

## EMC Specifications

| Parameter | Description | Criterion |
| :--- | :---: | :---: |

## Control

Specification is valid for input voltage, load, and temperature ranges, unless otherwise stated.

| Parameter | Conditions/Description |
| :---: | :---: |
| Status Indication | LEDs: DC OK (green), AC OK (green); fan fail and overtemperature (amber) |
| $1^{2} \mathrm{C}$ digital bus | Monitors alarm functions and sets parameters |
| PS present pin | Contact closure to logic ground ( internal pull-down resistor of $1 \mathrm{k} \Omega$ ) |
| PS remote shutdown / Inhibit pin | TTL compatible signal, inhibited when open contact, high or at TTL logic "1". Signal referenced to logic return (LRTN) |
| Power supply OK ( $\left.\mathrm{I}^{2} \mathrm{C}\right)^{1}$ | AC OK \& DC OK \& no overcurrent \& no overtemperature \& fans working |
| DC current fail ( $\left.{ }^{2} \mathrm{C}\right)^{1}$ | Overcurrent on $\mathrm{I}_{01}$ |
| AC fail / Power down warning $\left(I^{2} \mathrm{C} \& O C\right)^{2}$ | Provides a warning that the input power has failed at least 5 ms before the output falls out of regulation ( $<90 \% \mathrm{~V}_{\text {o1 set }}$ ). <br> Open collector signal with 20 mA pull-down capability, referenced to logic return (LRTN). AC fail will go high or open during power fail condition and will go low when input is within the operating range. <br> A Power Fail warning will turn off the green AC OK LED. |
| DC fail / Output voltage fault $\left(I^{2} \mathrm{C} \& \mathrm{OC}\right)^{2}$ | Internal undervoltage and overvoltage supervision of $V_{01}$. <br> Open collector signal with 20 mA pull-down capability, referenced to logic return (LRTN). <br> DC fail will go high or open if $V_{01}$ is $<90 \%$ or $>110 \%$ of $V_{01 \text { set }}$, measured in front of the ORing FETs. <br> A green LED on the front panel indicates normal operation. <br> The LED will flash if in parallel operation $V_{01}$ is OK , but the unit is disabled. |
| Temperature warning ( $\mathrm{I}^{2} \mathrm{C}$ \& OC) ${ }^{2}$ | $I^{2} \mathrm{C}$ critical temperature warning: Indicates that the operating temperature has reached [ $\mathrm{T}_{\text {shut-down }}-10 \mathrm{~K}$ ] <br> $I^{2} \mathrm{C}$ \& $O C$ overtemperature warning: Indicates if the unit is in overtemperature shutdown. Open collector signal with 20 mA pull-down capability, referenced to logic return (LRTN). The OC-output will go low 100 ms before an overtemperature condition shuts down the unit. <br> An amber LED on the front panel indicates overtemperature or fan fail. |
| DC voltage monitoring $\left(I^{2} \mathrm{C}\right)^{1}$ | Monitors the voltage $V_{01}$ at the output connector. <br> Accuracy $\pm 0.45 \mathrm{~V}$ over setting range, temperature and load. |
| DC current monitoring ( $\left.I^{2} \mathrm{C}\right)^{1}$ | Monitors the output current $I_{01}$ : Accuracy $\pm 0.4 \mathrm{~A}$ over the load range. |
| DC voltage trimming $\left(I^{2} \mathrm{C}\right.$ or external resistor) ${ }^{1}$ | Output voltage trimming $V_{01}: \pm 8 \%$ of $V_{\text {oset }}$ <br> Setting accuracy over $I^{2} \mathrm{C}: \pm 50 \mathrm{mV}$ at Vo nom, $\pm 150 \mathrm{mV}$ over setting range |
| Fan speed control ( $\left.{ }^{2} \mathrm{C}\right)^{1}$ | Two fan speed levels automatically set depending on the internal temperature. The fan speed can be set to full speed or automatic control. |
| Fan OK ( ${ }^{2} \mathrm{C}$ \& OC) ${ }^{2}$ | Indicates if the fans are operating or have failed. |
| Synch. startup pin | Overcurrent signal which can be used for synchronous startup of units in parallel or to recover from an overload condition. (See application note). |

${ }^{1}$ Detailed $I^{2} C$ information is available from the model's $I^{2} C$ Manual found on the Power-One web site.
${ }^{2}$ Provided over the $I^{2} \mathrm{C}$ interface and as an open collector signal on the output connector (OC).

## Output Connector Pinning and Signal Specification

| Output Connector Description | Pin Location | Type | Low level High level | $V$ max <br> 1 max |
| :---: | :---: | :---: | :---: | :---: |
| Overtemperature / Fan Fail | U1 | OC-output, protected by 16 V Zener diode and a $10 \Omega$ resistor in series, referenced to logic GND | $\begin{gathered} \hline<0.4 \mathrm{~V} @ 20 \mathrm{~mA} \\ \text { Pull up } \end{gathered}$ | $\begin{gathered} 15 \mathrm{~V} \\ 20 \mathrm{~mA} \end{gathered}$ |
| AC Fail / Power down warning | U2 | OC-output, protected by 16 V Zener diode and a $10 \Omega$ resistor in series, referenced to logic GND | $\begin{gathered} <0.4 \mathrm{~V} @ 20 \mathrm{~mA} \\ \text { Pull up } \end{gathered}$ | $\begin{gathered} 15 \mathrm{~V} \\ 20 \mathrm{~mA} \end{gathered}$ |
| Power Supply Present | U3 | Resistor (1 k $\Omega$ ) connected to logic GND | Open Pull up | $\begin{gathered} 10 \mathrm{~V} \\ 10 \mathrm{~mA} \end{gathered}$ |
| DC Fail / Output voltage fault | U4 | OC-output, protected by 16 V Zener diode and a $10 \Omega$ resistor in series, referenced to logic GND | $\begin{gathered} <0.4 \mathrm{~V} @ 20 \mathrm{~mA} \\ \text { Pull up } \end{gathered}$ | $\begin{gathered} 15 \mathrm{~V} \\ 20 \mathrm{~mA} \end{gathered}$ |
| Internal ground | U5 | Internal ground ( $\mathrm{V}_{01}$ - line before the output filter). Do not connect the internal grounds in systems with several units. |  |  |
| ADDR0, $I^{2} \mathrm{C}$ address bus | T1 | DIP switch or wire to internal ground, Internally pull up to 5 V ( $10 \mathrm{k} \Omega$ ). | Switch closed Switch open | 5V |
| ADDR1, $I^{2} \mathrm{C}$ address bus | T2 | DIP switch or wire to internal ground, Internally pull up to $5 \mathrm{~V}(10 \mathrm{k} \Omega)$. | Switch closed Switch open | 5 V |
| ADDR2, $I^{2} \mathrm{C}$ address bus | T3 | DIP switch or wire to internal ground, Internally pull up to $5 \mathrm{~V}(10 \mathrm{k} \Omega)$. | Switch closed Switch open | 5 V |
| ADDR3, $I^{2} \mathrm{C}$ address bus | T4 | DIP switch or wire to internal ground, Internally pull up to $5 \mathrm{~V}(10 \mathrm{k} \Omega)$. | Switch closed Switch open | 5 V |
| ADDR4, $I^{2} \mathrm{C}$ address bus | T5 | DIP switch or wire to internal ground, Internally pull up to 5 V ( $10 \mathrm{k} \Omega$ ). | Switch closed Switch open | 5V |
| DATA, ${ }^{2} \mathrm{C}$ data line | S1 | $I^{2} \mathrm{C}$ compatible signal referenced to logic GND | 5 V or 3.3 V logic |  |
| CLOCK, $\mathrm{I}^{2} \mathrm{C}$ clock line | S2 | $I^{2} \mathrm{C}$ compatible signal referenced to logic GND | 5 V or 3.3 V logic |  |
| $V_{\text {o2 }}+$ output | S3 | Auxiliary power pin, insulated from main output |  |  |
| $V_{\text {o2 }}$ - output | S4 | Auxiliary ground pin, insulated from main output |  |  |
| Logic ground | S5 | Internally connected over $10 \Omega$ to Auxiliary GND. Wire separately form Auxiliary - and main output GND to minimize noise on signals and $I^{2} C$. Leave open if not used. |  |  |
| Output inhibit | R1 | PS active when pulled low (DC-DC stage off when left open) Referenced to logic GND | $\begin{aligned} & <0.8 \mathrm{~V} \\ & >2.0 \mathrm{~V} \end{aligned}$ | $\begin{gathered} 10 \mathrm{~V} \\ 3.5 \mathrm{~mA} \end{gathered}$ |
| $V$ sense + | R2 | Open or connected to $V_{01}+$ at the load (Internally connected to $V_{01}+$ over $100 \Omega$ ) |  | $\begin{gathered} \mathrm{dU}<3 \mathrm{~V}_{\mathrm{pp}} \\ 30 \mathrm{~mA} \end{gathered}$ |
| V sense - | R3 | Open or connected to $V_{01}$ - at the load (Internally connected to $V_{01}$ - over $100 \Omega$ ) |  | $\begin{gathered} \mathrm{dU}<3 \mathrm{~V}_{\mathrm{pp}} \\ 30 \mathrm{~mA} \end{gathered}$ |
| 12V models | R4 | Open or connected over resistor to internal ground. Do not connect the margin pins in systems with several units. |  | 3 VDC |
| Output margin <br> 48 V models | R4 | Open or connected to internal ground $\left(+8 \% V_{01}\right)$ or $V_{\text {sense+ }}\left(-8 \% V_{01}\right)$ Do not connect the margin pins in systems with several units. |  | 60 VDC |
| 12V models | R5 | Open or connected to synch startup circuit, referenced to $\mathrm{V}_{01}$ - at the output connector |  | $\begin{aligned} & 12 \mathrm{~V} \\ & 3 \mathrm{~mA} \end{aligned}$ |
| 48V models | R5 | Open or connected to synch startup circuit, referenced to $\mathrm{V}_{01}$ - at the output connector |  | $\begin{gathered} 12 \mathrm{~V} \\ 2 \mathrm{~mA} \end{gathered}$ |
| $V_{01}+$ output 12V models | $\begin{gathered} \text { P2, P4, P6, P8, } \\ \text { P10, P12 } \end{gathered}$ | Main output + pins |  |  |
| $V_{01}$-output <br> 12V models | $\begin{aligned} & \text { P1, P3, P5, } \\ & \text { P7, P9, P11 } \end{aligned}$ | Main output - pins |  |  |
| $V_{01}+$ output 48 V models | P2, P4, P6 | Main output + pins |  |  |

## Paralleling Front-Ends:

For parallel use in minimal configuration systems, only the inhibit pins must be shorted to logic GND. All other pins can be left open. The power supplies will share the output current automatically (droop current share).
For parallel applications without $I^{2} C$ bus, but the use of all other features, it is recommended to connect all logic GND's on a backplane together, to connect all $\mathrm{V}_{\mathrm{o2}}-$, all $\mathrm{V}_{\mathrm{o} 2}+$ and to leave the internal GND's open.
The sense wires can be left open or connected to a common load point, the synch-start pin can be left open or connected to a synch-start circuit, the inhibit pins can be connected together or used individually. All ${ }^{2} \mathrm{C}$ signals (T1-T5, S1, and S2) can be left open.
Use of a small foil capacitor $>3 \mu \mathrm{~F}$ directly at the power outputs of each unit is recommended in order to prevent voltage drops at the hot plug. For additional information on paralleling see the following Rack (Power Shelf) section.

## Racks

Each rack (power shelf) is 1 U high with backplane and designed for up to three front-end models in parallel or in $\mathrm{n}+1$ operation. Each power shelf has:

- Massive copper bus bars for low-loss current distribution.
- Output terminals with two M4-screws on each power tab.
- Two fast-on contacts for system earthing.
- Address coding over five pole DIP switch on each unit, 37-pin D-Sub connector with $I^{2}$ C-lines, monitoring signals and support functions.
- Provides a start-up synchronization circuit and EMV filters.

## Synchronized start-up circuit for paralleling operation

Because of hiccup overcurrent protection, when a supply reaches an overcurrent limit, the output voltage will immediately turn OFF and after a delay turn ON again. In parallel use, all power supplies have to start synchronized because of the internal hiccup behavior. Otherwise, the supply which has reached overcurrent first will go to hiccup; this will overload the other supplies, which then will also go to hiccup. When the first supply has recovered from hiccup (hiccup dead time), the others remain in hiccup. This will immediately drive the first one into hiccup once again. This means that without a start-up circuit, a system with several power supplies can never recover from an overload condition or start-up into full load.

The following additional circuit, required to reach synchronized startup, is already implemented inside the FNR-3-12G and FNR-3-48G shelves.

Changing the Shape of Power

## Synch Start-up Connection Between Shelves

The following connection between the shelves is required to achieve a parallel operation. The synch-start circuits inside the shelves inhibit all power supplies until the last one has recovered from its overcurrent condition and then synchronize the restart of the outputs.

Synch Start-up Circuit Description

| Description | Pin <br> Location, Definition | Type | Low level High level | $V_{\text {max }}$ <br> I max |
| :---: | :---: | :---: | :---: | :---: |
| Auxiliary power +12 V (Output 2) | 26 | $\mathrm{V}_{02}+$, Aux output, insulated from main output |  |  |
| Logic ground | 28 | Logic_GND ,Internally connected over $10 \Omega$ to <br> $\mathrm{V}_{02}{ }^{-}$, ( Auxiliary power ground (Output 2)) |  |  |
| Output inhibit_A PSU 1-3 | 12 | Inhibit_A ,Active low (DC-DC stage off) Referenced to Logic_GND | $\begin{aligned} & <0.8 \mathrm{~V} \\ & >2.0 \mathrm{~V} \end{aligned}$ | $\begin{gathered} 10 \mathrm{~V} \\ 3.5 \mathrm{~mA} \end{gathered}$ |
| Synch. Startup 1 PSU 1-3 | R5 <br> (at PSU) | The synch_start pin is connected to the overcurrent signal of the PSU1-3. In the case of an overcurrent shutdown, this signal goes high. <br> Referenced to $\mathrm{V}_{01}{ }^{-}$ | $\begin{gathered} <7 \mathrm{~V} \text { off } \\ >9 \mathrm{~V} \end{gathered}$ | $\begin{gathered} 15 \mathrm{~V} \\ 10 \mathrm{~mA} \end{gathered}$ |
| Synch. Startup_A <br> Rack FNR-3-12G \& Rack FNR-3-48G 1-N Pin on the D-Sub connector on the backplane | 10 | Sync_start_A , Active high <br> The signals of several racks can be connected together in such a way that all supplies will be inhibited until the last supply has recovered from its overcurrent condition. <br> Referenced to Logic_GND |  |  |

NOTE: The Sync-Start pins can be wired together only if the power supplies are connected with a minimal voltage drop on power ground as achieved on a backplane with massive copper bus bars. If there is a less ideal connection, it is recommended to use an opto-coupler for each unit (IC1, D3, D2).

Mechanical Data (FNR-3-12G and FNR-3-48G Power Shelves)

## Accessories:

Center Angular Brackets are set in the middle for shelf mounting:

Center Angular Bracket sets can be ordered: Power-One part no.: HZZ01222 Note: Each Center Angular Bracket set contains 2 brackets and 8 screws.

## Fulcrum:

The handle has been designed to allow easy plug-in and -out in a rack system. The handle (lever) fits into a counter piece (fulcrum) which is fixed to the bottom of the rack. During the plug, the fulcrum holds the unit down and guides it towards the output connector. The Power-One part number of the fulcrum and its associated mounting accessories is: HZZ01223.

Individual fulcrum sets can be also ordered: Power-One part no.: HZZO1223.
Note: Each HZZ01223 set contain 2 fulcrums, 2 supports, and mounting accessories.

$I^{2} \mathrm{C}$ to USB Interface HZZ02002G:

$I^{2} C$ Management Software: All FNP front-ends can be controlled via Power-One's GUI-driven I ${ }^{2} \mathrm{C}$ Management software and an $I^{2} \mathrm{C}$-to-USB interface (P/N HZZO2002G). An $I^{2} \mathrm{C}$ Programming Manual describes the complete range of parameters that can be programmed to the FNP1500/1800 front-ends. This manual is available by searching on "FNP1500" at www.power-one.com.
