

STEVAL-ISA018V1 demonstration board based on resonant half-bridge SMPS for industrial applications

Introduction

This user manual describes a high efficiency solution for industrial power supplies with a continuous output power of 150 W and peak power up to 240 W. It takes advantage of the resonant approach to minimize switching losses, resulting in higher than 90% efficiency. The topology is based on half-bridge and operated in a resonant fashion by means of a resonant LC tank, driven by the L6599 dedicated controller.

The board provides one regulated output, $V_O=24\text{ V}$ with $I_O=6\text{ A}$, and an overload capability of up to $I_O=10\text{ A}$. Output voltage and current are controlled by the TSM1011 constant voltage and constant current controller, providing square output regulation, while the overload is managed by thermal protection (PTC) on the output rectifiers.

The board, shown in [Figure 1](#), is obtainable using the order code STEVAL-ISA018V1.

1 Demonstration board description

The STEVAL-ISA018V1 board is based on an LLC resonant converter, and employs the 5 Ω , 500 V STF21NM50N power MOSFET as the primary switches in the half-bridge. The STF21NM50N is produced using STMicroelectronics' proprietary high voltage MDmesh™ II technology. Thanks to this technology, the switch features a very low $R_{DS(on)}$ per area, low gate charge and high switching performance. The device is available in different packages, i.e. the TO-220, TO-247 and TO-220FH.

The demonstration board has been designed based on the specifications listed in [Table 1](#).

Table 1. Main specifications

Parameter	Value
Input voltage range	a. 185 to 265 Vac - b. 85 to 185 Vac (with voltage double)
Input frequency range	50/60 Hz
Output voltage	24 V \pm 2%
Output power	150 W (240Wpk)
Safety	EN60950
EMI	EN55014

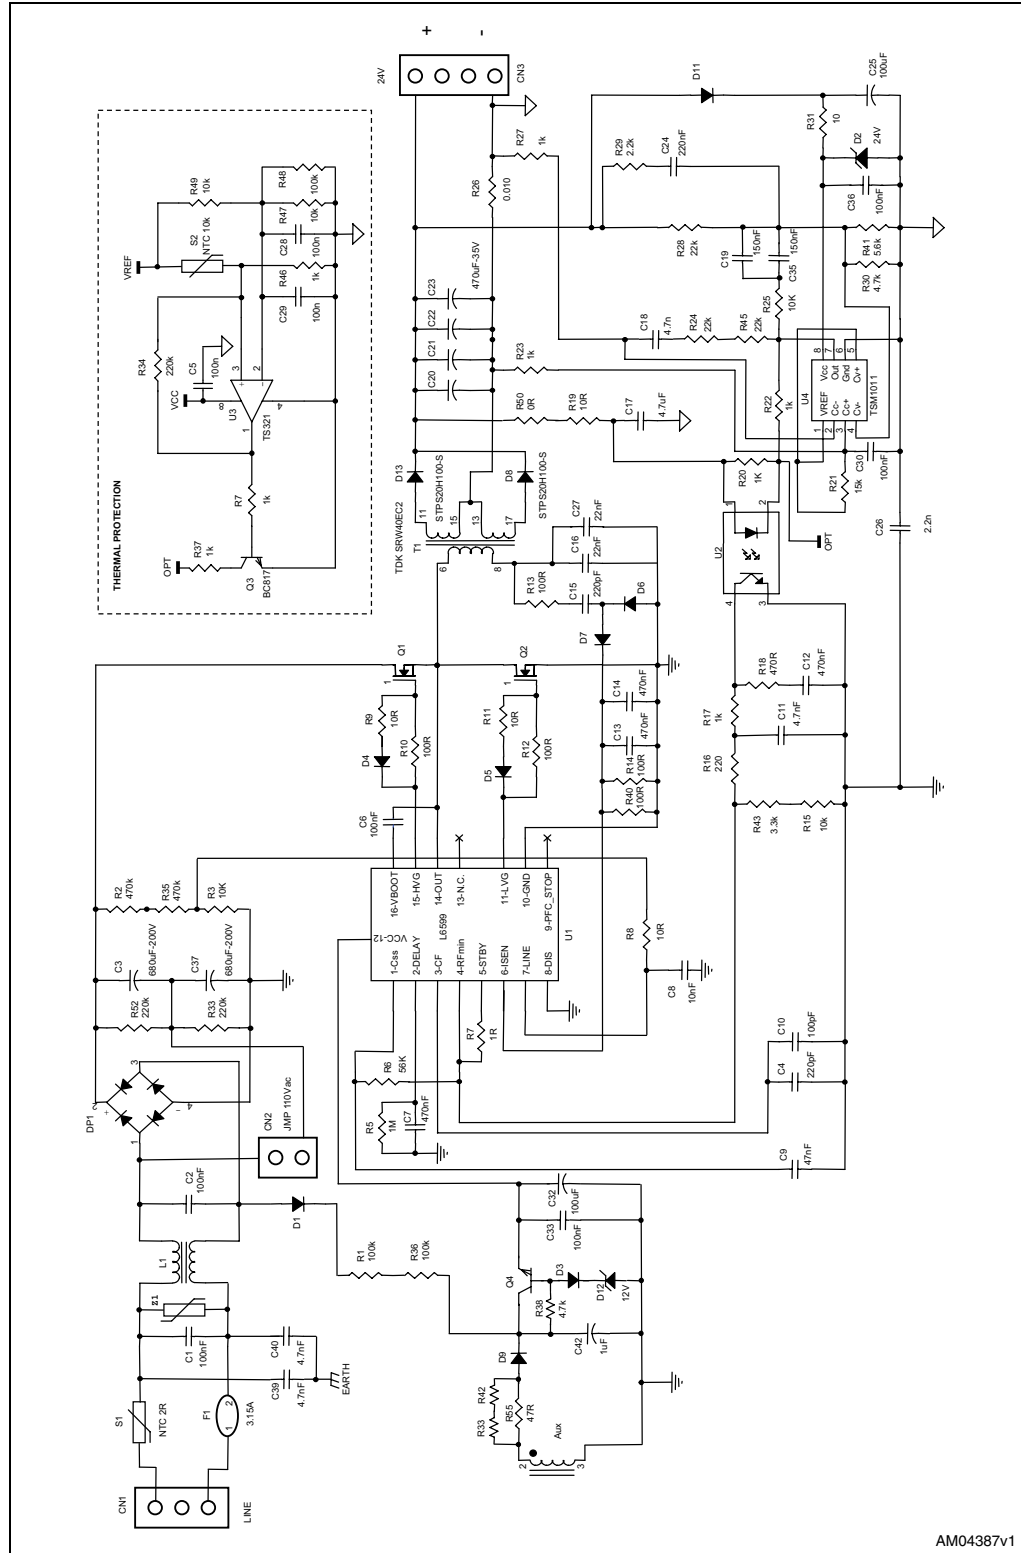

The electrical schematic of the board is shown in [Figure 2](#). The input section is provided with a connector for line input and a jumper for voltage double operation for a 110 Vac input voltage.

The output voltage is available on the CN3 connector. The converter is controlled by the L6599, a double ended primary controller for resonant half-bridge ZVS (zero voltage switching). The IC controls the output power, changing the switching frequency and controlling the half-bridge with a constant 50% duty cycle by means of a dedicated pin, connected to the output feedback through an optocoupler. Light load conditions are managed, with optimized consumption, thanks to burst mode operation. The IC also includes a disable function and two-level over-current protection with programmable delay.

In order to properly run the half-bridge devices and guarantee high efficiency, the IC features an internal P- channel D-MOS transistor with a typical $R_{DS(on)}$ of 200 m Ω as a switching element to avoid the use of a bootstrap capacitor.

During normal operation the IC is powered by the auxiliary winding of the transformer via the D9 diode. A discrete linear voltage regulator is connected in order to stabilize the auxiliary voltage fluctuations. The circuit consists of Q4, C42, R38, D3, D12, C32 and C33.

Figure 2. Schematic

Regulation of the output voltage is performed by secondary feedback on the 24 V output. The feedback network consists of a programmable voltage reference, TSM1011, driving an optocoupler which ensures the required insulation between the primary and secondary sections. The optotransistor drives the feedback pin (RFMIN) which controls the operation of the IC.

The resonant transformer is based on a two-slot coil former and an EER39-PC40 ferrite core, manufactured by TDK. The transformer ensures safety insulation in accordance with EN60950.

In [Table 2](#) the main features of the transformer are listed and in [Figure 3](#) and [4](#) the pinout and the geometrical characteristics are shown respectively.

Table 2. Resonant transformer specifications

Parameter	Value
Core	EER39 – PC40
Coil former	2 slot
Primary inductance, Lp	450 μ H \pm 10%
Leakage inductance, Llk	150 μ H \pm 10%
Primary turns, Np	32 (0.15x20) – 220 m Ω (DC)
Secondary turns, Ns	2x7 (0.2x30) (bifilar) – 40 m Ω (DC)
Auxiliary turns, Naux	8 (on primary winding)

Figure 3. Resonant transformer: pinout

AM04388v1

Figure 4. Resonant transformer: mechanical drawing

The output voltage can be adjusted down to 1.235 V by a voltage divider. An internal oscillator fixes the switching frequency up to 500 kHz to minimize the size of external components. The power IC features several layers of protection, such as pulse by pulse current limit with internal frequency modulation aimed at an effective constant current short circuit protection, feedback disconnection and thermal shutdown. Finally, it can be synchronized using a dedicated pin as well as inhibited for reduced standby power consumption and time sequence operations.

The board layout is shown in [Figure 5](#). The whole power supply is produced on a double side 35 μm PCB FR-4 (130 x 66 mm).

Z1	VK300	Varistor 300 V

2 Experimental waveforms

In this section some experimental waveforms are given. The contents of the following images show the output ripple, both at low frequency and high frequency, the short circuit protection operations and the startup and shutdown waveforms.

Figure 6. Midpoint voltage and transformer current - $V_{in} = 230\text{ Vac}$, $V_{out}=24.6\text{ V}$, $I_{out} = 2\text{ A}$ (CH1: HB midpoint voltage; CH2: transformer current)

Figure 7. Midpoint voltage and transformer current - $V_{in} = 230\text{ Vac}$, $V_{out}=24.6\text{ V}$, $I_{out} = 2\text{ A}$ (CH1: HB midpoint voltage; CH2: transformer current)

Figure 8. Midpoint voltage and transformer current - $V_{in} = 230\text{ Vac}$, $V_{out}=24.6\text{ V}$, $I_{out} = 2\text{ A}$ (CH1: HB midpoint voltage; CH2: transformer current)

Figure 9. Midpoint voltage and transformer current - $V_{in} = 230\text{ Vac}$, $V_{out}=24.6\text{ V}$, $I_{out} = 2\text{ A}$ (CH1: HB midpoint voltage; CH2: transformer current)

Figure 10. Midpoint voltage and transformer current - $V_{in} = 230 \text{ Vac}$, $V_{out} = 24.6 \text{ V}$, $I_{out} = 2 \text{ A}$ (CH1: HB midpoint voltage; CH2: transformer current)

3 EMI measurements

EMI behavior has been evaluated, as shown in [Figure 11](#) and [12](#), and measurements have been obtained using the standard settings with a $50\ \Omega$ LISN and a spectrum analyzer using the peak detector. The emissions are below the limit of the quasi-peak mask although the peak detector has been used, confirming the suitability of the topology with “light” EMI filters.

Figure 11. Conducted emissions - phase - $V_{in} = 230\ \text{Vac}$, $I_{out} = 6\ \text{A}$

Figure 12. Conducted emissions - neutral - $V_{in} = 230\ \text{Vac}$, $I_{out} = 6\ \text{A}$

4 Conclusions

This document describes the STEVAL-ISA018V1 demonstration board which implements a single output SMPS for industrial applications. The power supply is based on the L6599 resonant controller and uses the latest MDmesh II power MOSFET technology in order to achieve very high efficiency in all the operating range.
