

Title	Reference Design Report for a 6 W Constant Voltage (CV) Adapter Using LNK625PG		
Specification	90 – 265 VAC Input; 5 V, 1.2 A Output		
Application	Low-Cost Charger or Adapter		
Author Applications Engineering Department			
Document Number	RDR-201		
Date November 11, 2008			
Revision 1.5			

Summary and Features

- Eliminates optocoupler and all secondary side control circuitry
- EcoSmart[®] Easily meets all existing and proposed international energy efficiency standards – China (CECP) / EISA / Energy STAR / European Commission
 - ON/OFF control provides constant efficiency event at very light loads
 - No-load consumption <100 mW at 265 VAC
 - Meets ENERGY STAR 2.0 active mode efficiency
 - 76 % vs 70 % requirement at board
 - 73 % vs 70 % requirement at end of 6 ft, 315 m Ω output cable
 - Ultra-low leakage current: <5 µA at 265 VAC input (no Y capacitor required)
- Over-temperature protection tight tolerance (±5%) with hysteretic recovery for safe PCB temperatures under all conditions
- Auto-restart output short circuit and open-loop protection
- Easy compliance to EN550022 and CISPR-22 Class B EMI standards
- Green package: halogen free and RoHS compliant

PATENT INFORMATION

The products and applications illustrated herein (including transformer construction and circuits external to the products) may be covered by one or more U.S. and foreign patents, or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations' patents may be found at www.powerint.com. Power Integrations grants its customers a license under certain patent rights as set forth at <htp://www.powerint.com/ip.htm>.

Important Note:

Although this board is designed to satisfy safety isolation requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

1 Introduction

This document is an engineering report describing a universal input, 5 V, 6 W output Flyback power supply. This reference design is based on the LinkSwitch-CV family of devices and utilizes the LNK625PG.

The document contains the power supply specification, schematic, bill of materials, transformer documentation, printed circuit layout, and performance data.

3 Schematic

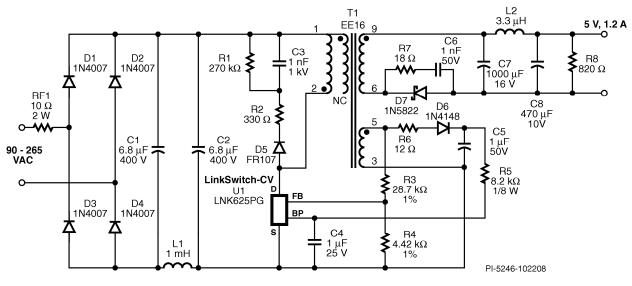

Figure 2 – Schematic

4 Circuit Description

The schematic in Figure 2 shows an adapter design using the LNK625PG that provides very tight constant voltage (CV) performance. The circuit is designed to operate from 90 VAC to 265 VAC input, with an output voltage of 5 V providing a maximum load current of 1.2 A. It consumes very little standby power and uses no Y-Capacitor to meet stringent EMI requirements. The adapter also meets and exceeds both CEC and Energy Star 2.0 regulations.

4.1 Input and EMI Filtering

Diodes D1 through D4 form a full wave rectifier. The rectified DC is then filtered by capacitors C1 and C2. Inductor L1 forms a pi (π) filter with capacitors C1 and C2 which helps to reduce differential EMI noise. This filtering, together with the integrated switching frequency jitter provided in U1 and transformer E-Shield techniques, provide a generous EMI margin without the need for a Y capacitor across the primary and secondary windings of transformer T1.

4.2 LinkSwitch-CV Device

The LinkSwitch-CV family of devices has been developed to cost effectively replace all existing solutions in low power adapter applications. It is optimized for constant voltage (CV) adapter applications while using minimal external parts including the complete elimination of the optocoupler and shunt regulator.

The LNK625PG monolithically integrates the 700 V power MOSFET switch and controller, which consists of an oscillator, feedback (sense and logic) circuit, 6 V regulator, BYPASS pin programming functions, over-temperature protection, frequency jittering, current limit circuit and leading-edge blanking.

The LNK625PG also provides a sophisticated range of protection features including autorestart for control loop component open/short circuit faults and output short circuit conditions. The use of a low auto-restart on time reduces the power delivered by more than 95 % for output short circuits and control loop faults. Accurate hysteretic thermal shutdown ensures safe average PCB temperatures under all conditions. Extended creepage distance between high and low voltage pins prevent arcing and helps meet safety requirements. *LinkSwitch-CV* also can be used without a bias winding as the IC is completely self biased.

4.3 Primary Circuit

During U1's on time current flows through the primary winding of transformer T1 and stores energy in its magnetic field. During U1's off time, the energy stored in the transformer is transferred to the secondary side, delivering current to both the output capacitors and the load.

The clamp circuit formed by resistors R1 and R2 along with blocking diode D5 and capacitor C3 ensures that the drain node voltage is well below the 700 V rating of the internal MOSFET of U1. The clamp circuit is also carefully designed to reduce and dampen any oscillation present in the voltage spike caused by the transformer's leakage inductance.

4.4 Output Rectification

The secondary output is rectified by diode D7 which is placed in the return leg to help reduce EMI and simplify the transformer construction. An RC snubber circuit composed of resistor R7 and capacitor C6 is placed across the output diode to also reduce high frequency EMI. A stable output voltage is maintained by capacitor C7.

Inductor L2 and capacitor C8 form an LC post filter which helps to attenuate switching noise and reduces output ripple. Resistor R8 is a preload resistor whose value has been empirically chosen to provide the best possible regulation at light loads without significantly affecting no-load input power or efficiency.

4.5 Feedback Winding

LinkSwitch-CV eliminates the need for an optocoupler for tight output voltage regulation, as good as ± 5 %, through the use of a feedback winding. The feedback (FB) pin voltage, which is derived from the voltage divider formed by resistors R3 and R4, is sampled approximately 2.5 µs after U1's internal MOSFET turns off. Based upon this information the device regulates the output voltage.

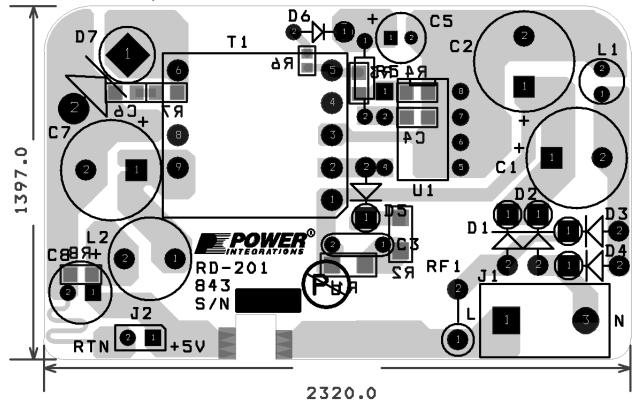

The feedback winding was also designed with more turns than necessary so that it may act as a bias winding. The winding provides bias current to U1 through the bypass pin (BP) and reduces the input power consumption during light loads and no-load conditions. Resistor R6 helps to dampen out any ringing present on the feedback winding and ensures that the waveform at the FB pin at 2.5 us is free from any ringing. Capacitor C5 provides a stable bias voltage while resistor R5 is chosen to supply the necessary BP pin current. Capacitor C4 is the BP pin capacitor and should be placed as close as possible to the BP pin and source pins of the device.

5 PCB Layout

Notable layout design points are:

- 1 A spark gap and associated slot in the PCB between the primary and secondary is placed to protect the power supply from electro-static discharge (ESD).
 - The preferential arcing point routes the energy from ESD discharges back to the AC input, away from the transformer and primary circuitry.
 - The trace connected to the AC input side of the spark gap is spaced away from the rest of the board and its components to prevent arc discharges to other sections of the circuit.
- 2 The drain trace length (pin 4 of U1) has been minimized to reduce EMI.
- 3 Clamp and output diode loop areas are minimized to reduce EMI.
- 4 A large copper area around the (electrically quiet) Source pins is used to provide heatsinking. Provide sufficient copper area to keep the source pin temperature below 90 °C.
- 5 The AC input is located away from switching nodes to minimize noise coupling that may bypass input filtering.
- 6 Place C4 (the bypass capacitor) as close as possible to the BYPASS pin on U1.

6W Adaptor

7.2 Electrical Specifications

Electrical Strength	1 second, 60 Hz, from Pins1-2 to Pins 6-9	3000 VAC
Primary Inductance	Pins 1-2, all other windings open	1.67 mH ±10%
Resonant Frequency	Pins 1-2, all other windings open	500 kHz (Min.)
Primary Leakage Inductance	Pins 1-2, with Pins 6,9,3 and 5 shorted.	100 μH (Max.)

7.3 Materials

Item	Description
[1]	Core: EE16, NC-2H or equivalent, gapped for 126 nH/T ²
[2]	Bobbin: EE16, Horizontal, 10 pins, (5/5)
[3]	Magnet wire: #34 AWG, double coated.
[4]	Magnet wire: #36 AWG, double coated.
[5]	Triple Insulated wire: #27 TIW
[6]	Tape: 3M 1298 Polyester Film, 2 mils thick, 8.6 mm wide.
[7]	Varnish

7.4 Transformer Build Diagram

7.5 Transformer Construction

Bobbin	Pull pins 7 and 10. Orient the bobbin with primary pins on the left hand side. Winding
Preparation	direction is clockwise.
Winding 1:	Start on pin 5 and wind 19 turns of bifilar item [3] from left to right terminating on pin 3.
Feedback	
Insulation	Apply 4 layers of tape item [6].
	Start on pin 2 and wind 39 turns of item [3], with tight tension, from left to right filling one
Winding 2:	layer. Apply one layer of tape item [6]. Continue winding 38 turns of item [3] from right to
Primary Winding	left and apply one layer of tape item [6]. Wind the remaining 38 turns of item [3] from left
	to right and terminate the winding on pin 1.
Insulation	Apply one layer of tape item [6].
Winding 3:	Start on any temporary secondary pin, leaving extra wire, and wind 16 turns of trifilar item [4] from right to left filling one layer. Secure the winding temporarily with tape and
Shield	cut the finish end of the winding. Move the starting end of the winding to pin 1.
Insulation	Wrap two complete layers of tape over any leads of the previous winding.
Winding 4:	Start on pin 9 and wind 7 turns of item [6] from right to left terminating on pin 6.
Secondary	
Insulation	Apply 2 layers of tape item [6]
Assembly	Assemble core halves and tape together after properly gapping center leg of core.
Finish	Dip Varnish

9 Performance Data

All measurements performed at room temperature, 60 Hz input frequency unless otherwise stated.

9.1 Active Mode Efficiency

Efficiency was measured at the end of a AWG24 cable 6 ft in length (cable resistance = 315 m $\Omega)$

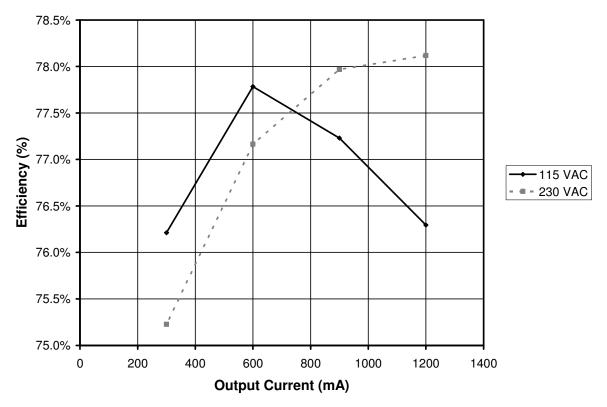

Figure 6 – Efficiency vs. Load, Room Temperature, 60 Hz.

Percent of Full Load	Efficiency (%)		
	115 VAC	230 VAC	
25	74.6	73.6	
50	74.6	74.3	
75	72.9	73.6	
100	70.8	72.5	
Average	73.2	73.5	
US EISA (2007) requirement	66.1		
ENERGY STAR 2.0 requirement	69.5		

Table 1 – Efficiency Table.

Page 15 of 32

9.2 Energy Efficiency Requirements

The external power supply requirements below all require meeting active mode efficiency and no-load input power limits. Minimum active mode efficiency is defined as the average efficiency of 25, 50, 75 and 100% of output current (based on the nameplate output current rating).

For adapters that are single input voltage only then the measurement is made at the rated single nominal input voltage (115 VAC or 230 VAC), for universal input adapters the measurement is made at both nominal input voltages (115 VAC and 230 VAC).

To meet the standard the measured average efficiency (or efficiencies for universal input supplies) must be greater than or equal to the efficiency specified by the standard.

The test method can be found here:

http://www.energystar.gov/ia/partners/prod_development/downloads/power_supplies/EP SupplyEffic_TestMethod_0804.pdf

For the latest up to date information please visit the PI Green Room:

http://www.powerint.com/greenroom/regulations.htm

9.2.1 USA Energy Independence and Security Act 2007

This legislation mandates all single output single output adapters, including those provided with products, manufactured on or after July 1st, 2008 must meet minimum active mode efficiency and no load input power limits.

Active Mode Efficiency Standard Models

Nameplate Output (Po)	Minimum Efficiency in Active Mode of Operation
< 1 W	$0.5 \times P_{O}$
\geq 1 W to \leq 51 W	$0.09 \times \ln (P_0) + 0.5$
> 51 W	0.85
	In – natural logarithm

In = natural logarithm

No-load Energy Consumption

Nameplate Output (Po)	Maximum Power for No-load AC-DC EPS	
All	≤ 0.5 W	

This requirement supersedes the legislation from individual US States (for example CEC in California).

9.2.2 ENERGY STAR EPS Version 2.0

This specification takes effect on November 1st, 2008.

Active Mode Efficiency Standard Models

Nameplate Output (P ₀)	Minimum Efficiency in Active Mode of Operation
≤ 1 W	$0.48 \times P_{O} + 0.14$
> 1 W to ≤ 49 W	0.0626 × ln (P _o) + 0.622
> 49 W	0.87
	In - natural logarithm

In = natural logarithm

Active Mode Efficiency Low Voltage Models (V₀<6 V and I₀ \ge 550 mA)

Nameplate Output (P ₀)	Minimum Efficiency in Active Mode of Operation
≤ 1 W	0.497 × P _O + 0.067
$>$ 1 W to \leq 49 W	0.075 × ln (P _o) + 0.561
> 49 W	0.86

In = natural logarithm

No-load Energy Consumption (both models)

Nameplate Output (Po)	Maximum Power for No-load AC-DC EPS		
0 to < 50 W	≤ 0.3 W		
\geq 50 W to \leq 250 W	≤ 0.5 W		

9.3 No-load Input Power

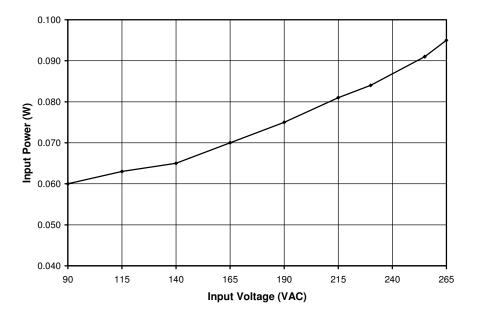

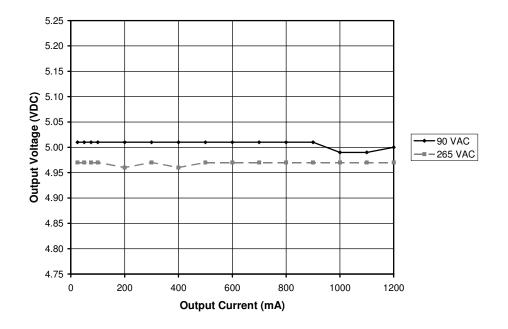

Figure 7 – Zero Load Input Power vs. Input Line Voltage, Room Temperature, 60 Hz.

9.4 Regulation

9.4.1 Load

Page 19 of 32

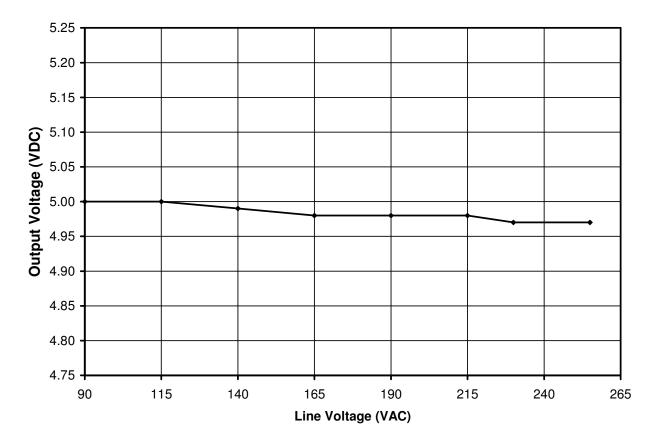

Figure 9 – Line Regulation, Room Temperature, Full Load.

10 Thermal Performance

The temperature of key components was measured to evaluate the thermal performance of the power supply. The power supply's thermal performance was measured at both low line (90 VAC) and high line (265 VAC) with line frequency of 50 Hz. The power supply was loaded to full load (1200 mA).

The power supply was placed inside a cardboard box, to minimize convective cooling, which was then placed in a thermal chamber. The ambient temperature within the box was monitored by a T-type thermocouple placed above the power supply. The temperature of the Power Integrations device, U1, was monitored by soldering a T-type thermocouple to one of the middle source pins, close to the case. The temperature of the transformer windings (T1) was monitored by gluing a T-type thermocouple, using thermally conductive epoxy, to the outermost layer of tape on the bottom of the transformer (closest to the PCB). Lastly the output diode's (D7) temperature was monitored by soldering a T-type thermocouple to the anode, near the case.

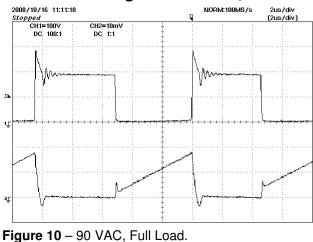

Item	Temperature (°C)		
	90 VAC / 50 Hz	265 VAC / 50 Hz	
Ambient	40	40	
Source Pin of PI Device (U1)	87	69	
Transformer Windings (T1)	70	67

11.4 Load Transient Response (75% to 100% Load Step)

In the figures shown below, signal averaging was used to better enable viewing the load transient response. The oscilloscope was triggered using the load current step as a trigger source. Since the output switching and line frequency occur essentially at random with respect to the load transient, contributions to the output ripple from these sources will average out, leaving the contribution only from the load step response.

Figure 18 – Transient Response, 90 VAC 75-100-75% Load Step. Upper: Output Voltage 10 mV, 10 ms / div. Bottom: Load Current, 0.5 A / div.

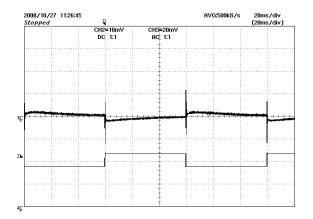

Figure 19 – Transient Response, 265 VAC 75-100-75% Load Step. Upper: Load Current, 1 A/ div. Bottom: Output Voltage 50 mV, 2 ms / div.

11.5 Output Ripple Measurements

11.5.1 Ripple Measurement Technique

For DC output ripple measurements, use a modified oscilloscope test probe to reduce spurious signals. Details of the probe modification are provided in figures below.

Tie two capacitors in parallel across the probe tip of the 4987BA probe adapter. Use a 0.1 μ F/50 V ceramic capacitor and a 1.0 μ F/50 V aluminum-electrolytic capacitor. The aluminum-electrolytic capacitor is polarized, so always maintain proper polarity across DC outputs.

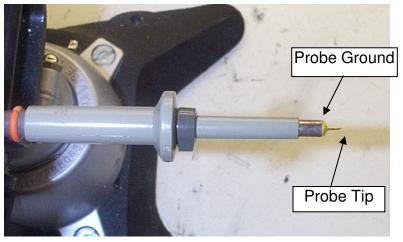

Figure 20 – Oscilloscope Probe Prepared for Ripple Measurement. (End Cap and Ground Lead Removed)

Figure 21 – Oscilloscope Probe with Probe Master (<u>www.probemaster.com</u>) 4987A BNC Adapter. (Modified with wires for ripple measurement, and two parallel decoupling capacitors added)

11.5.2 Measurement Results

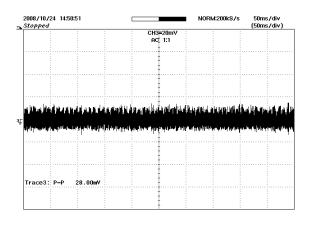

Figure 22 – Ripple, 90 VAC, Full Load. 50 ms, 20 mV / div.

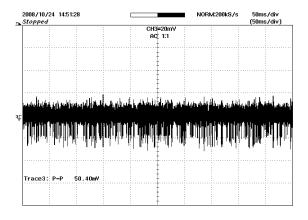

Figure 23 – 265 VAC, Full Load. 50 ms, 20 mV / div.

12 Line Surge

Differential input line 1.2/50 μ s surge testing was completed on a single test unit to IEC61000-4-5. Input voltage was set at 230 VAC / 60 Hz. Output was loaded at full load and operation was verified following each surge event.

Surge Level (V)	Input Voltage (VAC)	Injection Location	Injection Phase (°)	Test Result (10 Strikes Pass/Fail)
+500	230	L to N (2 Ω)	90	Pass
+1000	230	L to PE (12 Ω)	90	Pass
+1000	230	L to N (2 Ω)	90	Pass
+2000	230	L to PE (12 Ω)	90	Pass

Unit passes under all test conditions.

13 Conducted EMI
