Sup*IR*Buck™

USER GUIDE FOR IR3812 EVALUATION BOARD

DESCRIPTION

The IR3812 is a synchronous buck converter, providing a compact, high performance and flexible solution in a small 5mmx6mm Power QFN package.

Key features offered by IR3812 include tracking capability for memory application, programmable soft-start ramp, precision 0.6V reference voltage, thermal protection, fixed 600kHz switching frequency requiring no external component, input under-voltage lockout for proper start-up, and pre-bias start-up.

An output over-current protection function is implemented by sensing the voltage developed across the on-resistance of the synchronous rectifier MOSFET for optimum cost and performance.

This user guide contains the schematic and bill of materials for the IR3812 evaluation board. The guide describes operation and use of the evaluation board itself. Detailed application information for IR3812 is available in the IR3812 data sheet.

BOARD FEATURES

- V_{in} = +12V (13.2V Max)

- Tracking Input

- V_{out} = 0.75V @ 0- 4A V_p:0.6V

- L= 1.0uH

- C_{in}= 3x10uF (ceramic 1206)

- C_{out}= 4x22uF (ceramic 0805)

CONNECTIONS and OPERATING INSTRUCTIONS

A well regulated +12V input supply should be connected to VIN+ and VIN-.   A maximum 4A load should be connected to VOUT+ and VOUT-. The connection diagram is shown in Fig. 1 and inputs and outputs of the board are listed in Table I.

IR3812 has two input supplies, one for biasing (Vcc) and the other as input voltage (Vin). These inputs are connected on the board with a zero ohm resistor (R15). *Vcc input cannot be connected unless R15 is removed.* Vcc input should be a well regulated 5V-12V supply and it would be connected to Vcc+ and Vcc-.

Vp pin is connected to the internal reference (Vref) via R14 as the default configuration. External input can be applied to Vp. *For tacking applications, R14 should be removed, R17 should be inserted, and the external tracking source should be applied between Vp_Ext and Agnd.* The value of R17 and R28 can be selected to provide the desired ratio between the output voltage and the tracking input. *For proper operation of IR3811, the voltage at Vp pin should be kept between 0.2V to 1.0V.*

Table I. Connections

Connection	Signal Name
VIN+	V_{in} (+12V)
VIN-	Ground of V_{in}
Vcc+	Optional Vcc input
Vcc-	Ground for optional Vcc input
VOUT-	Ground of V_{out}
VOUT+	V_{out} (+1.8V)
Vp_Ext	Optional Tracking input
Agnd	Analog (Signal) Ground

LAYOUT

The PCB is a 4-layer board. All of layers are 2 Oz. copper. The IR3812 SupIRBuck and all of the passive components are mounted on the top side of the board.

Power supply decoupling capacitors, the charge-pump capacitor and feedback components are located close to IR3812. The feedback resistors are connected to the output voltage at the point of regulation and are located close to the SupIRBuck.

To improve efficiency, the circuit board is designed to minimize the length of the on-board power ground current path.

PCB Metal and Components Placement

The lead lands (the 11 IC pins) width should be equal to the nominal part lead width. The minimum lead to lead spacing should be ≥ 0.2mm to minimize shorting.

Lead land length should be equal to the maximum part lead length + 0.3 mm outboard extension. The outboard extension ensures a large and inspectable toe fillet.

The pad lands (the 4 big pads other than the 11 IC pins) length and width should be equal to maximum part pad length and width. However, the minimum metal to metal spacing should be no less than 0.17mm for 2 oz. Copper; no less than 0.1mm for 1 oz. Copper and no less than 0.23mm for 3 oz. Copper.

All Dimensions in mm

PCB Copper
Component pad
Soldermask

Solder Resist

It is recommended that the lead lands are Non Solder Mask Defined (NSMD). The solder resist should be pulled away from the metal lead lands by a minimum of 0.025mm to ensure NSMD pads.

The land pad should be Solder Mask Defined (SMD), with a minimum overlap of the solder resist onto the copper of 0.05mm to accommodate solder resist mis-alignment.

Ensure that the solder resist in between the lead lands and the pad land is ≥ 0.15mm due to the high aspect ratio of the solder resist strip separating the lead lands from the pad land.

All Dimensions in mm
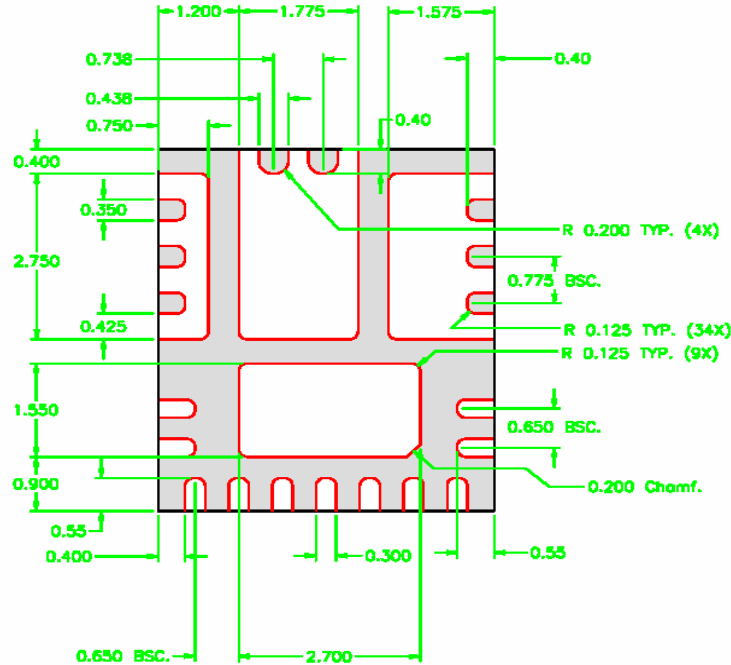

PCB Copper
PCB Solder Resist
Stencil Design

- The Stencil apertures for the lead lands should be approximately 80% of the area of the lead lads. Reducing the amount of solder deposited will minimize the occurrences of lead shorts. If too much solder is deposited on the center pad the part will float and the lead lands will be open.

- The maximum length and width of the land pad stencil aperture should be equal to the solder resist opening minus an annular 0.2mm pull back to decrease the incidence of shorting the center land to the lead lands when the part is pushed into the solder paste.

Stencil Aperture
