

LM3431 Evaluation Board

National Semiconductor
Application Note 1764
Allan Fisher
January 10, 2008

Introduction

The LM3431 is a combination switching boost voltage regulator and multi-channel LED current controller. The LM3431 Evaluation Board is designed to drive 4 parallel strings of 8 series LEDs at 140mA per string from an input voltage range of 8V to 18V. The boost switcher regulates LED cathode voltage for optimum efficiency, while allowing the output voltage to vary according to the LED forward voltage. The LM3431 incorporates complete fault protection features including LED short and open protection, over-current protection, over-voltage and under-voltage protection, and thermal shutdown. The error detection flag can be monitored at the DLY post, which has a programmable delay time.

The board includes a DIM input terminal for a selectable digital or analog dimming control signal. PWM dimming frequencies up to 1kHz at 100:1 contrast ratio and contrast ratios up to 500:1 at 200Hz are possible.

The evaluation board is designed to operate at ambient temperatures up to 70°C.

The complete evaluation board schematic is shown in Figure 2. Typical waveforms and performance curves are shown in Figures 3-8.

Although a wide variety of LED combinations and currents can be driven with the LM3431, the schematic must be modified to achieve optimum performance with any given array. However, for initial evaluation and demonstration, some modifications from the default settings are possible. A few of the possible variations are described below and listed in Tables 2 and 3.

LED current can be set as low as 100mA per string without significantly degrading performance; the number of strings can be reduced from 4 to 3 or 2; and the number of series LEDs can be set between 6 and 9.

To design for LED arrays other than the default, and for complete device and design information, refer to the LM3431 datasheet.

Before Powering Up

Before powering up the LM3431 evaluation board, a few options must be selected.

First, verify that the default LED current setting of 140mA is appropriate to drive the LEDs. To drive LEDs at other currents, refer to Table 2. If the required LED current is not listed, refer to the LM3431 datasheet, as more extensive modifications will be required.

By default, the LM3431 evaluation board has channels 1-4 enabled. To drive fewer channels, first remove the sense resistor or NPN on the channel to be disabled (R10-R13 or Q2-Q5). Then refer to Table 3 and make any other required changes. Table 3 also gives options for driving fewer LEDs per string.

Finally, select the type of dimming control signal to be used. By default, R-MODE is installed, which enables digital dimming control mode. To use this mode, connect a digital PWM signal to the DIM post. The dimming signal must have a minimum high logic level of 2.3V.

To enable analog dimming, remove the MODE resistor and connect an analog voltage level to the DIM post. In analog mode, the dimming duty cycle is varied by the voltage at the DIM post within a range of 0.37V to 2.5V. The default analog dimming frequency is 1kHz. To modify this frequency, change C5 as described in the datasheet.

Any dimming frequency between 180Hz and 20kHz can be used in either digital or analog dimming control mode. However the default schematic is not designed for dimming frequencies above 1kHz. Once the evaluation board has been configured, connect the LED strings as shown in Figure 2. The first anode of each string connects to the VA post and the last cathode of each string connects to VC1 through VC4. LEDs can be connected either via the 8-pin header or to the terminal posts. Figure 1 shows the pinout of the header.

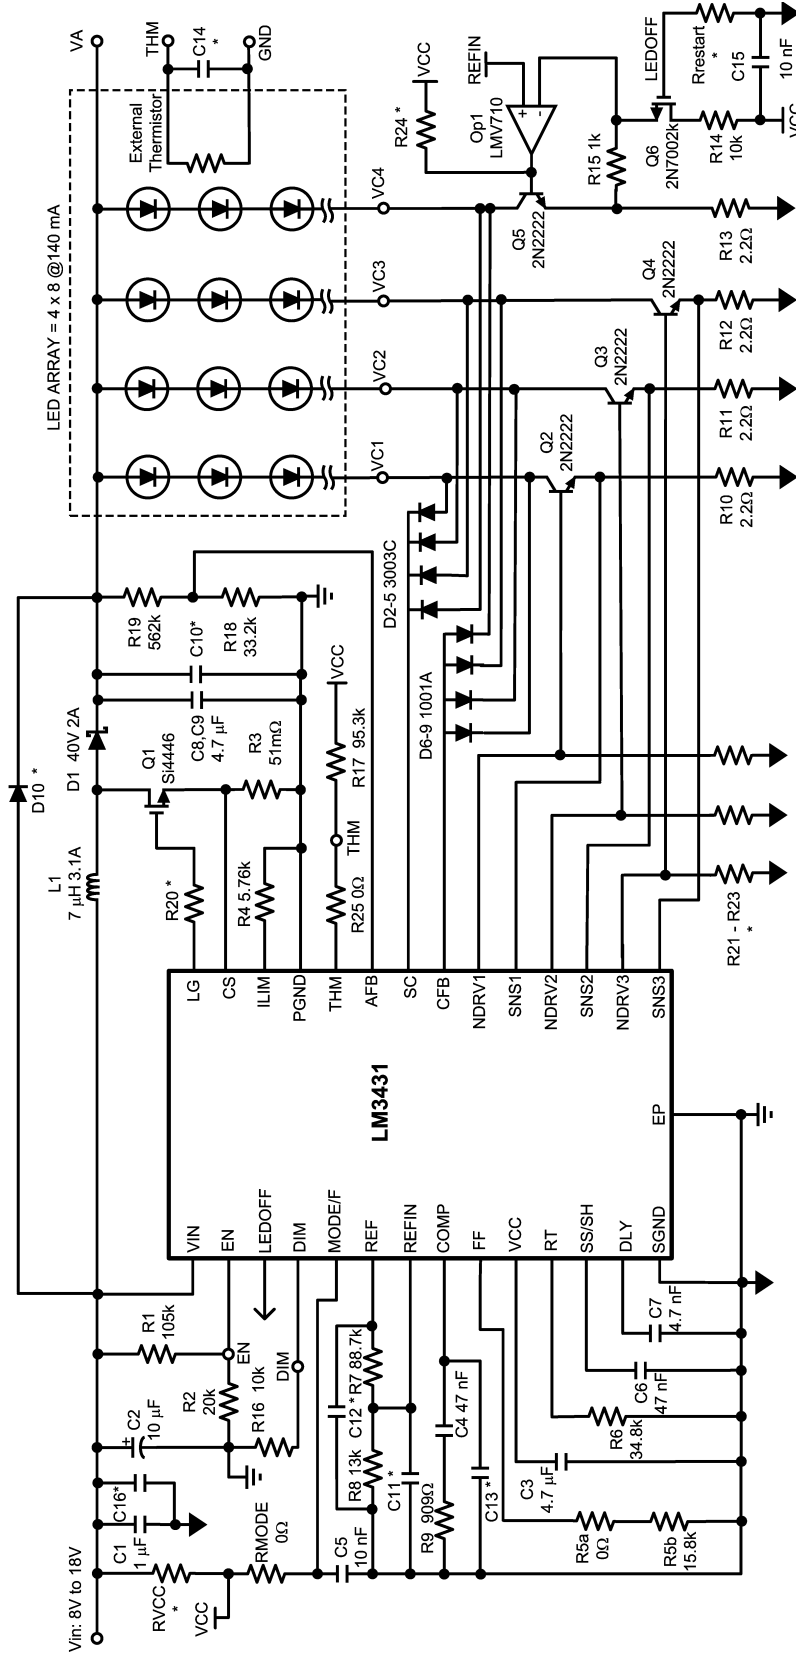

30046801

FIGURE 1. LED Connection, Top View Header Pinout

Connect the input voltage supply to the VIN and GND posts. When all connections and polarities have been verified, power can be applied. When the input voltage rises above 7.7V typically, the EN pin will cross the UVLO threshold and the LM3431 will startup. EN can be pulled low (via the EN post) to shutdown the evaluation board.

8V to 18V input
 700 kHz switching, 180 Hz – 1 kHz dimming
 4 strings of 8 LEDs, 140 mA per string

Optional Components

Several of the components shown in the schematic are not installed and are optional. These components are typically not required, but may be useful in some applications. C10 is provided for adding additional output capacitance or for using more capacitors with smaller case sizes. C11 and C12 can be used to filter reference voltage noise. Noise at the REF_IN pin can appear as noise in the LED current. Whether these capacitors are required depends on the amount of switching noise, type of NPN used, and how much noise is tolerable in the LED current. C13 is a second compensation capacitor, which may be required if a high ESR output capacitor is used. Refer to the datasheet for details. D10 provides a current path from VIN to VA during startup. By bypassing the inductor, D10 prevents VA from rising above VIN at the initial power-on. In some conditions an OVP fault may occur at startup without D10 installed. R20 is a gate drive resistor for the NFET, Q1. An R20 value of up to 10Ω can be used to reduce the rise and fall time of the gate drive to reduce switching noise. To install R20, first cut the trace between the R20 pads. R21-R23 are NDRV pull-down resistors. A value of 300Ω to 1k can reduce LED current noise. These resistors are typically most effective when driving NFET current regulators. RVCC connects VCC to VIN. For 5V input applications, a 4.7Ω resistor should be installed here to pull-up VCC. For these applications, additional input capacitance at C16 may also be required. R-restart enables the automatic restart function. Auto-restart cannot be enabled when four LED channels are used. If 3 or fewer channels are being driven, install R-restart with 0Ω to enable the auto-restart function, which restarts the LM3431 after a fault shutdown. R-MODE selects the DIM control mode as was described previously. For lower current applications, there is a second Q1 pad which fits SOT-23 size NFETs. An external NTC thermistor can be connected either between the THM pad and SGND terminal post or via pins 7 and 8 on the 8-pin header. This thermistor is used to monitor LED temperature. With the installed R17 value, the LM3431 will enter standby when the thermistor resistance falls to 31kΩ. For example, a thermistor with a 25°C resistance of 680k and a beta constant of 4125 will yield a shutdown temperature of 110°C. R25 is a hysteresis resistor for the THM function. The default value is 0Ω which results in a restart hysteresis of 10°C. Use R25 to increase the THM hysteresis according to the datasheet description. C14 can be installed as a noise filter for the external thermistor voltage.

LED String Options

Tables 2 and 3 give the required component changes for driving LED arrays other than the default. The values shown assume a typical LED Vf of 3.2V at 140mA. These tables are designed for simplicity and ease of modification, not optimum performance. Therefore, any of the changes listed below will result in a lower maximum contrast ratio as compared to the default LED array. For optimum performance, all component values should be reviewed. R5 in the tables refers to the sum of R5a and R5b shown on the schematic. For the best performance, R5 can be manually adjusted for the specific input voltage, dimming frequency, and LED current of each application.

TABLE 2. LED Current Settings (nc = no change)

LED current	R7	R8	R5
160mA	78.7k	13k	nc
130mA	100k	13k	17.4k
115mA	115k	13k	18.7k
100mA	93.1k	9.09k	20k

TABLE 3. LED Array Options at 140mA Setting (nc = no change)

2 Strings				
# of LEDs	R19	R3	R5	R6
6	432k	80m	24.9k	43.2k
7	499k	90m	28.7k	26.7k
8	nc	70m	30.1k	23.2k
3 Strings				
6	432k	nc	28k	43.2k
7	499k	nc	24.3k	nc
8	nc	nc	20k	nc
9	634k	nc	19.1k	30.1k
4 Strings				
6	432k	nc	19.1k	43.2k
7	499k	nc	16.9k	nc
9	634k	40m	14.3k	nc

Typical Evaluation Board Performance

Unless otherwise specified, the following conditions apply: $V_{in} = 12V$, $T_a = 25^{\circ}C$, LED array = 4 parallel strings of 8 LEDs at 140mA per string. LED part number: Nichia NFSW036BT.
