## NOTES

1. The range of coil current for $A C$ relay is $\pm 15 \%(60 \mathrm{~Hz})$. For DC relay it is $\pm 10 \%$ at $20^{\circ} \mathrm{C}$.
2. The JA relay will operate in a range from $80 \%$ to $110 \%$ of the nominal coil voltage. It is however, recommended that the relay be used in the range of $85 \%$ to $110 \%$ of the nominal coil voltage, with the temporary voltage variation taken into consideration.
3. When the operating voltage of AC relays drops below $80 \%$ of the nominal coil voltage. The relay will generate a consider able amount of heat which is not recommended for maximum efficiency.
4. The coil resistance of DC types is the measured value of the coil at a temperature of $20^{\circ} \mathrm{C}\left(68^{\circ} \mathrm{F}\right)$. If the coil temperature changes by $\pm 1^{\circ} \mathrm{C}$. The measured value of the coil resis tance should be increased or decreased by $0.4 \%$.
