

STM32F103xC STM32F103xD STM32F103xE

High-density performance line ARM-based 32-bit MCU with 256 to 512KB Flash, USB, CAN, 11 timers, 3 ADCs, 13 communication interfaces

Features

- Core: ARM 32-bit Cortex™-M3 CPU
 - 72 MHz maximum frequency, 1.25 DMIPS/MHz (Dhrystone 2.1) performance at 0 wait state memory access
 - Single-cycle multiplication and hardware division
- Memories
 - 256 to 512 Kbytes of Flash memory
 - up to 64 Kbytes of SRAM
 - Flexible static memory controller with 4 Chip Select. Supports Compact Flash, SRAM, PSRAM, NOR and NAND memories
 - LCD parallel interface, 8080/6800 modes
- Clock, reset and supply management
 - 2.0 to 3.6 V application supply and I/Os
 - POR, PDR, and programmable voltage detector (PVD)
 - 4-to-16 MHz crystal oscillator
 - Internal 8 MHz factory-trimmed RC
 - Internal 40 kHz RC with calibration
 - 32 kHz oscillator for RTC with calibration
- Low power
 - Sleep, Stop and Standby modes
 - V_{BAT} supply for RTC and backup registers
- 3 × 12-bit, 1 μs A/D converters (up to 21 channels)
 - Conversion range: 0 to 3.6 V
 - Triple-sample and hold capability
 - Temperature sensor
- 2 × 12-bit D/A converters
- DMA: 12-channel DMA controller
 - Supported peripherals: timers, ADCs, DAC, SDIO, I²Ss, SPIs, I²Cs and USARTs
- Debug mode
 - Serial wire debug (SWD) & JTAG interfaces
 - Cortex-M3 Embedded Trace Macrocell™

- Up to 112 fast I/O ports
 - 51/80/112 I/Os, all mappable on 16 external interrupt vectors and almost all 5 V-tolerant
- Up to 11 timers
 - Up to four 16-bit timers, each with up to 4 IC/OC/PWM or pulse counter and quadrature (incremental) encoder input
 - 2 × 16-bit motor control PWM timers with dead-time generation and emergency stop
 - 2 × watchdog timers (Independent and Window)
 - SysTick timer: a 24-bit downcounter
 - 2 × 16-bit basic timers to drive the DAC
- Up to 13 communication interfaces
 - Up to 2 × I²C interfaces (SMBus/PMBus)
 - Up to 5 USARTs (ISO 7816 interface, LIN, IrDA capability, modem control)
 - Up to 3 SPIs (18 Mbit/s), 2 with I²S interface multiplexed
 - CAN interface (2.0B Active)
 - USB 2.0 full speed interface
 - SDIO interface
- CRC calculation unit, 96-bit unique ID
- ECOPACK® packages

1 Introduction

This datasheet provides the ordering information and mechanical device characteristics of the STM32F103xC, STM32F103xD and STM32F103xE high-density performance line microcontrollers. For more details on the whole STMicroelectronics STM32F103xx family, please refer to [Section 2.2: Full compatibility throughout the family](#).

The high-density STM32F103xx datasheet should be read in conjunction with the STM32F10xxx reference manual.

For information on programming, erasing and protection of the internal Flash memory please refer to the *STM32F10xxx Flash programming manual*.

The reference and Flash programming manuals are both available from the STMicroelectronics website www.st.com.

For information on the Cortex™-M3 core please refer to the Cortex™-M3 Technical Reference Manual, available from the www.arm.com website at the following address: <http://infocenter.arm.com/help/index.jsp?topic=/com.arm.doc.ddi0337e/>.

2 Description

The STM32F103xC, STM32F103xD and STM32F103xE performance line family incorporates the high-performance ARM[®] Cortex™-M3 32-bit RISC core operating at a 72 MHz frequency, high-speed embedded memories (Flash memory up to 512 Kbytes and SRAM up to 64 Kbytes), and an extensive range of enhanced I/Os and peripherals connected to two APB buses. All devices offer three 12-bit ADCs, four general-purpose 16-bit timers plus two PWM timers, as well as standard and advanced communication interfaces: up to two I²Cs, three SPIs, two I2Ss, one SDIO, five USARTs, an USB and a CAN.

The STM32F103xx high-density performance line family operates in the –40 to +105 °C temperature range, from a 2.0 to 3.6 V power supply. A comprehensive set of power-saving mode allows the design of low-power applications.

The STM32F103xx high-density performance line family offers devices in six different package types: from 64 pins to 144 pins. Depending on the device chosen, different sets of peripherals are included, the description below gives an overview of the complete range of peripherals proposed in this family.

These features make the STM32F103xx high-density performance line microcontroller family suitable for a wide range of applications:

- Motor drive and application control
- Medical and handheld equipment
- PC peripherals gaming and GPS platforms
- Industrial applications, PLC, inverters, printers, and scanners
- Alarm systems, video intercom, and HVAC

Figure 1 shows the general block diagram of the device family.

2.1 Device overview

| Number of channels | | 2 | | | | | | | | |
| CPU frequency | | 72 MHz | | | | | | | | |
| Operating voltage | | 2.0 to 3.6 V | | | | | | | | |
| Operating temperatures | | Ambient temperatures: -40 to +85 °C / -40 to +105 °C (see Table 10) Junction temperature: -40 to + 125 °C (see Table 10) | | | | | | | | |
| Package | | LQFP64 | WLCSP64 | LQFP100, BGA100 | | | LQFP144, BGA144 | | | |

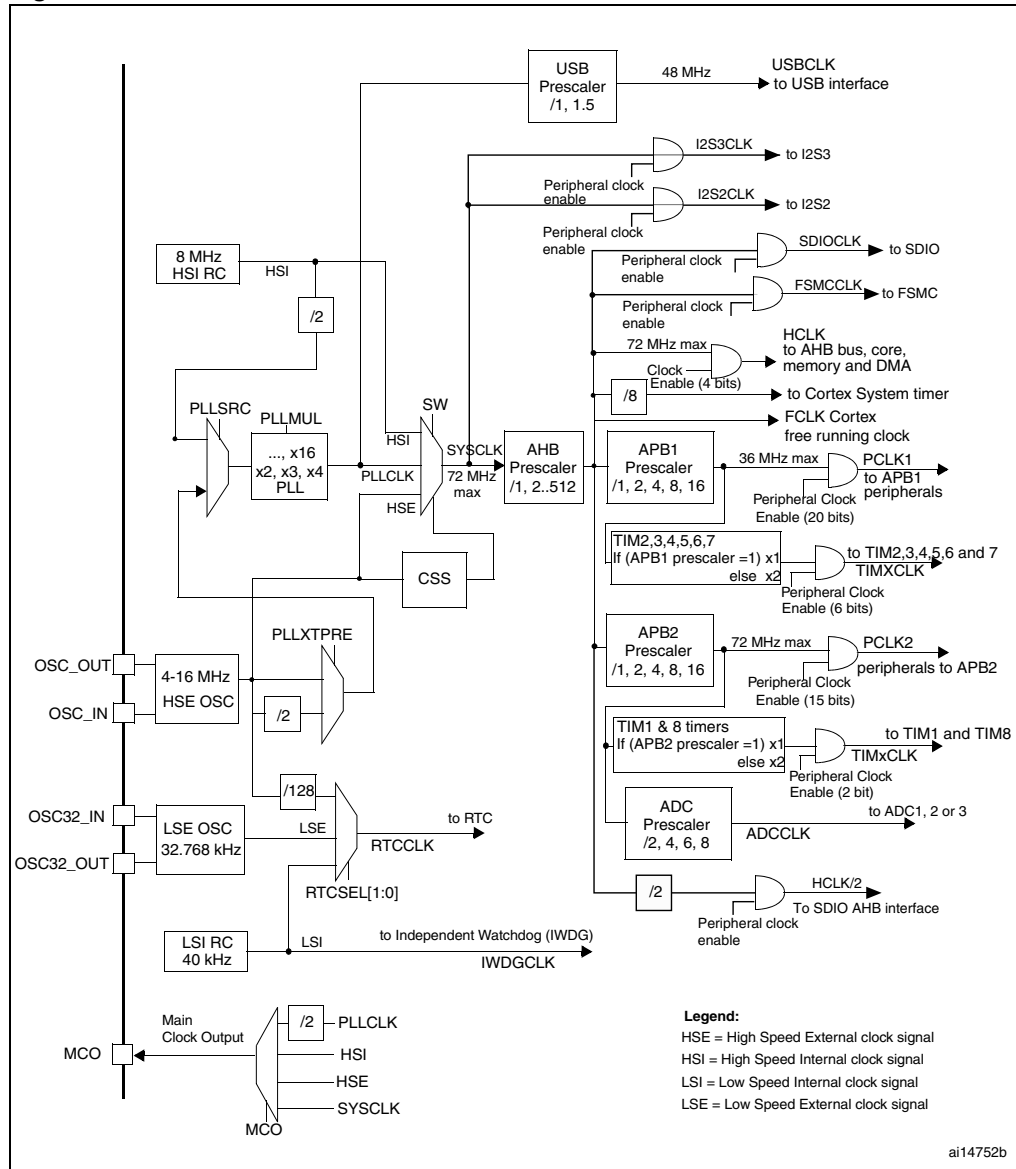

- 64 KB RAM for 256 KB Flash are available on devices delivered in CSP packages only.
- For the LQFP100 and BGA100 packages, only FSMC Bank1 and Bank2 are available. Bank1 can only support a multiplexed NOR/PSRAM memory using the NE1 Chip Select. Bank2 can only support a 16- or 8-bit NAND Flash memory using the NCE2 Chip Select. The interrupt line cannot be used since Port G is not available in this package.
- The SPI2 and SPI3 interfaces give the flexibility to work in an exclusive way in either the SPI mode or the I²S audio mode.

Figure 1. STM32F103xC, STM32F103xD and STM32F103xE performance line block diagram

1. $T_A = -40\text{ }^\circ\text{C}$ to $+85\text{ }^\circ\text{C}$ (suffix 6, see [Table 71](#)) or $-40\text{ }^\circ\text{C}$ to $+105\text{ }^\circ\text{C}$ (suffix 7, see [Table 71](#)), junction temperature up to $105\text{ }^\circ\text{C}$ or $125\text{ }^\circ\text{C}$, respectively.
2. AF = alternate function on I/O port pin.

Figure 2. Clock tree

1. When the HSI is used as a PLL clock input, the maximum system clock frequency that can be achieved is 64 MHz.
2. For the USB function to be available, both HSE and PLL must be enabled, with the CPU running at either 48 MHz or 72 MHz.
3. To have an ADC conversion time of 1 μs, APB2 must be at 14 MHz, 28 MHz or 56 MHz.

2.2 Full compatibility throughout the family

The STM32F103xx is a complete family whose members are fully pin-to-pin, software and feature compatible. In the reference manual, the STM32F103x4 and STM32F103x6 are identified as low-density devices, the STM32F103x8 and STM32F103xB are referred to as medium-density devices and the STM32F103xC, STM32F103xD and STM32F103xE are referred to as high-density devices.

Low-density and high-density devices are an extension of the STM32F103x8/B medium-density devices, they are specified in the STM32F103x4/6 and STM32F103xC/D/E datasheets, respectively. Low-density devices feature lower Flash memory and RAM capacities, less timers and peripherals. High-density devices have higher Flash memory and RAM capacities, and additional peripherals like SDIO, FSMC, I²S and DAC while remaining fully compatible with the other members of the family.

The STM32F103x4, STM32F103x6, STM32F103xC, STM32F103xD and STM32F103xE are a drop-in replacement for the STM32F103x8/B devices, allowing the user to try different memory densities and providing a greater degree of freedom during the development cycle.

Moreover, the STM32F103xx performance line family is fully compatible with all existing STM32F101xx access line and STM32F102xx USB access line devices.

Table 3. STM32F103xx family

| Pinout | Low-density devices | | Medium-density devices | | High-density devices | | |
|--------|--|----------------------------|--|--------------|--|--------------|--------------|
| | 16 KB Flash | 32 KB Flash ⁽¹⁾ | 64 KB Flash | 128 KB Flash | 256 KB Flash | 384 KB Flash | 512 KB Flash |
| | 6 KB RAM | 10 KB RAM | 20 KB RAM | 20 KB RAM | 48 or 64 KB ⁽²⁾ RAM | 64 KB RAM | 64 KB RAM |
| 144 | | | | | 5 × USARTs | | |
| 100 | | | 3 × USARTs | | 4 × 16-bit timers, 2 × basic timers | | |
| 64 | 2 × USARTs 2 × 16-bit timers | | 3 × 16-bit timers | | 3 × SPIs, 2 × I ² Ss, 2 × I ² Cs | | |
| 48 | 1 × SPI, 1 × I ² C, USB, CAN, 1 × PWM timer | | 2 × SPIs, 2 × I ² Cs, USB, CAN, 1 × PWM timer | | USB, CAN, 2 × PWM timers | | |
| 36 | 2 × ADCs | | 2 × ADCs | | 3 × ADCs, 2 × DACs, 1 × SDIO FSMC (100- and 144-pin packages ⁽³⁾) | | |

- For orderable part numbers that do not show the A internal code after the temperature range code (6 or 7), the reference datasheet for electrical characteristics is that of the STM32F103x8/B medium-density devices.
- 64 KB RAM for 256 KB Flash are available on devices delivered in CSP packages only.
- Ports F and G are not available in devices delivered in 100-pin packages.

2.3 Overview

2.3.1 ARM® Cortex™-M3 core with embedded Flash and SRAM

The ARM Cortex™-M3 processor is the latest generation of ARM processors for embedded systems. It has been developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced system response to interrupts.

The ARM Cortex™-M3 32-bit RISC processor features exceptional code-efficiency, delivering the high-performance expected from an ARM core in the memory size usually associated with 8- and 16-bit devices.

With its embedded ARM core, STM32F103xC, STM32F103xD and STM32F103xE performance line family is compatible with all ARM tools and software.

Figure 1 shows the general block diagram of the device family.

2.3.2 Embedded Flash memory

Up to 512 Kbytes of embedded Flash is available for storing programs and data.

2.3.3 CRC (cyclic redundancy check) calculation unit

The CRC (cyclic redundancy check) calculation unit is used to get a CRC code from a 32-bit data word and a fixed generator polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the Flash memory integrity. The CRC calculation unit helps compute a signature of the software during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

2.3.4 Embedded SRAM

Up to 64 Kbytes of embedded SRAM accessed (read/write) at CPU clock speed with 0 wait states.

2.3.5 FSMC (flexible static memory controller)

The FSMC is embedded in the STM32F103xC, STM32F103xD and STM32F103xE performance line family. It has four Chip Select outputs supporting the following modes: PC Card/Compact Flash, SRAM, PSRAM, NOR and NAND.

Functionality overview:

- The three FSMC interrupt lines are ORed in order to be connected to the NVIC
- Write FIFO
- Code execution from external memory except for NAND Flash and PC Card
- The targeted frequency, f_{CLK} , is $HCLK/2$, so external access is at 36 MHz when HCLK is at 72 MHz and external access is at 24 MHz when HCLK is at 48 MHz

2.3.6 LCD parallel interface

The FSMC can be configured to interface seamlessly with most graphic LCD controllers. It supports the Intel 8080 and Motorola 6800 modes, and is flexible enough to adapt to specific LCD interfaces. This LCD parallel interface capability makes it easy to build cost-effective graphic applications using LCD modules with embedded controllers or high-performance solutions using external controllers with dedicated acceleration.

2.3.7 Nested vectored interrupt controller (NVIC)

The STM32F103xC, STM32F103xD and STM32F103xE performance line embeds a nested vectored interrupt controller able to handle up to 60 maskable interrupt channels (not including the 16 interrupt lines of Cortex™-M3) and 16 priority levels.

- Closely coupled NVIC gives low latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Closely coupled NVIC core interface
- Allows early processing of interrupts
- Processing of *late arriving* higher priority interrupts
- Support for tail-chaining
- Processor state automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

This hardware block provides flexible interrupt management features with minimal interrupt latency.

2.3.8 External interrupt/event controller (EXTI)

The external interrupt/event controller consists of 19 edge detector lines used to generate interrupt/event requests. Each line can be independently configured to select the trigger event (rising edge, falling edge, both) and can be masked independently. A pending register maintains the status of the interrupt requests. The EXTI can detect an external line with a pulse width shorter than the Internal APB2 clock period. Up to 112 GPIOs can be connected to the 16 external interrupt lines.

2.3.9 Clocks and startup

System clock selection is performed on startup, however the internal RC 8 MHz oscillator is selected as default CPU clock on reset. An external 4-16 MHz clock can be selected, in which case it is monitored for failure. If failure is detected, the system automatically switches back to the internal RC oscillator. A software interrupt is generated if enabled. Similarly, full interrupt management of the PLL clock entry is available when necessary (for example with failure of an indirectly used external oscillator).

Several prescalers allow the configuration of the AHB frequency, the high speed APB (APB2) and the low speed APB (APB1) domains. The maximum frequency of the AHB and the high speed APB domains is 72 MHz. The maximum allowed frequency of the low speed APB domain is 36 MHz. See [Figure 2](#) for details on the clock tree.

2.3.10 Boot modes

At startup, boot pins are used to select one of three boot options:

- Boot from User Flash
- Boot from System Memory
- Boot from embedded SRAM

The boot loader is located in System Memory. It is used to reprogram the Flash memory by using USART1.

2.3.11 Power supply schemes

- $V_{DD} = 2.0$ to 3.6 V: external power supply for I/Os and the internal regulator. Provided externally through V_{DD} pins.
- V_{SSA} , $V_{DDA} = 2.0$ to 3.6 V: external analog power supplies for ADC, Reset blocks, RCs and PLL (minimum voltage to be applied to V_{DDA} is 2.4 V when the ADC is used). V_{DDA} and V_{SSA} must be connected to V_{DD} and V_{SS} , respectively.
- $V_{BAT} = 1.8$ to 3.6 V: power supply for RTC, external clock 32 kHz oscillator and backup registers (through power switch) when V_{DD} is not present.

For more details on how to connect power pins, refer to [Figure 12: Power supply scheme](#).

2.3.12 Power supply supervisor

The device has an integrated power-on reset (POR)/power-down reset (PDR) circuitry. It is always active, and ensures proper operation starting from/down to 2 V. The device remains in reset mode when V_{DD} is below a specified threshold, $V_{POR/PDR}$, without the need for an external reset circuit.

The device features an embedded programmable voltage detector (PVD) that monitors the V_{DD}/V_{DDA} power supply and compares it to the V_{PVD} threshold. An interrupt can be generated when V_{DD}/V_{DDA} drops below the V_{PVD} threshold and/or when V_{DD}/V_{DDA} is higher than the V_{PVD} threshold. The interrupt service routine can then generate a warning message and/or put the MCU into a safe state. The PVD is enabled by software. Refer to [Table 12: Embedded reset and power control block characteristics](#) for the values of $V_{POR/PDR}$ and V_{PVD} .

2.3.13 Voltage regulator

The regulator has three operation modes: main (MR), low power (LPR) and power down.

- MR is used in the nominal regulation mode (Run)
- LPR is used in the Stop modes.
- Power down is used in Standby mode: the regulator output is in high impedance: the kernel circuitry is powered down, inducing zero consumption (but the contents of the registers and SRAM are lost)

This regulator is always enabled after reset. It is disabled in Standby mode.

2.3.14 Low-power modes

The STM32F103xC, STM32F103xD and STM32F103xE performance line supports three low-power modes to achieve the best compromise between low power consumption, short startup time and available wakeup sources:

- **Sleep mode**

In Sleep mode, only the CPU is stopped. All peripherals continue to operate and can wake up the CPU when an interrupt/event occurs.

- **Stop mode**

Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the 1.8 V domain are stopped, the PLL, the HSI RC and the HSE crystal oscillators are disabled. The voltage regulator can also be put either in normal or in low-power mode.

The device can be woken up from Stop mode by any of the EXTI line. The EXTI line source can be one of the 16 external lines, the PVD output, the RTC alarm or the USB wakeup.

- **Standby mode**

The Standby mode is used to achieve the lowest power consumption. The internal voltage regulator is switched off so that the entire 1.8 V domain is powered off. The PLL, the HSI RC and the HSE crystal oscillators are also switched off. After entering Standby mode, SRAM and register contents are lost except for registers in the Backup domain and Standby circuitry.

The device exits Standby mode when an external reset (NRST pin), an IWDG reset, a rising edge on the WKUP pin, or an RTC alarm occurs.

Note: The RTC, the IWDG, and the corresponding clock sources are not stopped by entering Stop or Standby mode.

2.3.15 DMA

The flexible 12-channel general-purpose DMAs (7 channels for DMA1 and 5 channels for DMA2) are able to manage memory-to-memory, peripheral-to-memory and memory-to-peripheral transfers. The two DMA controllers support circular buffer management, removing the need for user code intervention when the controller reaches the end of the buffer.

Each channel is connected to dedicated hardware DMA requests, with support for software trigger on each channel. Configuration is made by software and transfer sizes between source and destination are independent.

The DMA can be used with the main peripherals: SPI, I²C, USART, general-purpose, basic and advanced-control timers TIMx, DAC, I²S, SDIO and ADC.

2.3.16 RTC (real-time clock) and backup registers

The RTC and the backup registers are supplied through a switch that takes power either on V_{DD} supply when present or through the V_{BAT} pin. The backup registers are forty-two 16-bit registers used to store 84 bytes of user application data when V_{DD} power is not present. They are not reset by a system or power reset, and they are not reset when the device wakes up from the Standby mode.

The real-time clock provides a set of continuously running counters which can be used with suitable software to provide a clock calendar function, and provides an alarm interrupt and a

periodic interrupt. It is clocked by a 32.768 kHz external crystal, resonator or oscillator, the internal low power RC oscillator or the high-speed external clock divided by 128. The internal low-speed RC has a typical frequency of 40 kHz. The RTC can be calibrated using an external 512 Hz output to compensate for any natural quartz deviation. The RTC features a 32-bit programmable counter for long term measurement using the Compare register to generate an alarm. A 20-bit prescaler is used for the time base clock and is by default configured to generate a time base of 1 second from a clock at 32.768 kHz.

2.3.17 Timers and watchdogs

The high-density STM32F103xx performance line devices include up to two advanced-control timers, up to four general-purpose timers, two basic timers, two watchdog timers and a SysTick timer.

[Table 4](#) compares the features of the advanced-control, general-purpose and basic timers.

Table 4. High-density timer feature comparison

| Timer | Counter resolution | Counter type | Prescaler factor | DMA request generation | Capture/compare channels | Complementary outputs |
|------------------------|--------------------|-------------------|---------------------------------|------------------------|--------------------------|-----------------------|
| TIM1, TIM8 | 16-bit | Up, down, up/down | Any integer between 1 and 65536 | Yes | 4 | Yes |
| TIM2, TIM3, TIM4, TIM5 | 16-bit | Up, down, up/down | Any integer between 1 and 65536 | Yes | 4 | No |
| TIM6, TIM7 | 16-bit | Up | Any integer between 1 and 65536 | Yes | 0 | No |

Advanced-control timers (TIM1 and TIM8)

The two advanced-control timers (TIM1 and TIM8) can each be seen as a three-phase PWM multiplexed on 6 channels. They have complementary PWM outputs with programmable inserted dead-times. They can also be seen as a complete general-purpose timer. The 4 independent channels can be used for:

- Input capture
- Output compare
- PWM generation (edge or center-aligned modes)
- One-pulse mode output

If configured as a standard 16-bit timer, it has the same features as the TIMx timer. If configured as the 16-bit PWM generator, it has full modulation capability (0-100%).

In debug mode, the advanced-control timer counter can be frozen and the PWM outputs disabled to turn off any power switch driven by these outputs.

Many features are shared with those of the general-purpose TIM timers which have the same architecture. The advanced-control timer can therefore work together with the TIM timers via the Timer Link feature for synchronization or event chaining.

General-purpose timers (TIMx)

There are up to 4 synchronizable general-purpose timers (TIM2, TIM3, TIM4 and TIM5) embedded in the STM32F103xC, STM32F103xD and STM32F103xE performance line devices. These timers are based on a 16-bit auto-reload up/down counter, a 16-bit prescaler and feature 4 independent channels each for input capture/output compare, PWM or one-pulse mode output. This gives up to 16 input captures / output compares / PWMs on the largest packages.

The general-purpose timers can work together with the advanced-control timer via the Timer Link feature for synchronization or event chaining. Their counter can be frozen in debug mode. Any of the general-purpose timers can be used to generate PWM outputs. They all have independent DMA request generation.

These timers are capable of handling quadrature (incremental) encoder signals and the digital outputs from 1 to 3 hall-effect sensors.

Basic timers TIM6 and TIM7

These timers are mainly used for DAC trigger generation. They can also be used as a generic 16-bit time base.

Independent watchdog

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 40 kHz internal RC and as it operates independently from the main clock, it can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free running timer for application timeout management. It is hardware or software configurable through the option bytes. The counter can be frozen in debug mode.

Window watchdog

The window watchdog is based on a 7-bit downcounter that can be set as free running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the main clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard down counter. It features:

- A 24-bit down counter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0.
- Programmable clock source

2.3.18 I²C bus

Up to two I²C bus interfaces can operate in multimaster and slave modes. They can support standard and fast modes.

They support 7/10-bit addressing mode and 7-bit dual addressing mode (as slave). A hardware CRC generation/verification is embedded.

They can be served by DMA and they support SMBus 2.0/PMBus.

2.3.19 Universal synchronous/asynchronous receiver transmitters (USARTs)

The STM32F103xC, STM32F103xD and STM32F103xE performance line embeds three universal synchronous/asynchronous receiver transmitters (USART1, USART2 and USART3) and two universal asynchronous receiver transmitters (UART4 and UART5).

These five interfaces provide asynchronous communication, IrDA SIR ENDEC support, multiprocessor communication mode, single-wire half-duplex communication mode and have LIN Master/Slave capability.

The USART1 interface is able to communicate at speeds of up to 4.5 Mbit/s. The other available interfaces communicate at up to 2.25 Mbit/s.

USART1, USART2 and USART3 also provide hardware management of the CTS and RTS signals, Smart Card mode (ISO 7816 compliant) and SPI-like communication capability. All interfaces can be served by the DMA controller except for UART5.

2.3.20 Serial peripheral interface (SPI)

Up to three SPIs are able to communicate up to 18 Mbits/s in slave and master modes in full-duplex and simplex communication modes. The 3-bit prescaler gives 8 master mode frequencies and the frame is configurable to 8 bits or 16 bits. The hardware CRC generation/verification supports basic SD Card/MMC modes.

All SPIs can be served by the DMA controller.

2.3.21 Inter-integrated sound (I²S)

Two standard I²S interfaces (multiplexed with SPI2 and SPI3) are available, that can be operated in master or slave mode. These interfaces can be configured to operate with 16/32 bit resolution, as input or output channels. Audio sampling frequencies from 8 kHz up to 48 kHz are supported. When either or both of the I²S interfaces is/are configured in master mode, the master clock can be output to the external DAC/CODEC at 256 times the sampling frequency.

2.3.22 SDIO

An SD/SDIO/MMC host interface is available, that supports MultiMediaCard System Specification Version 4.2 in three different databus modes: 1-bit (default), 4-bit and 8-bit. The interface allows data transfer at up to 48 MHz in 8-bit mode, and is compliant with SD Memory Card Specifications Version 2.0.

The SDIO Card Specification Version 2.0 is also supported with two different databus modes: 1-bit (default) and 4-bit.

The current version supports only one SD/SDIO/MMC4.2 card at any one time and a stack of MMC4.1 or previous.

In addition to SD/SDIO/MMC, this interface is also fully compliant with the CE-ATA digital protocol Rev1.1.

2.3.23 Controller area network (CAN)

The CAN is compliant with specifications 2.0A and B (active) with a bit rate up to 1 Mbit/s. It can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers. It has three transmit mailboxes, two receive FIFOs with 3 stages and 14 scalable filter banks.

2.3.24 Universal serial bus (USB)

The STM32F103xC, STM32F103xD and STM32F103xE performance line embed a USB device peripheral compatible with the USB full-speed 12 Mbs. The USB interface implements a full-speed (12 Mbit/s) function interface. It has software-configurable endpoint setting and suspend/resume support. The dedicated 48 MHz clock is generated from the internal main PLL (the clock source must use a HSE crystal oscillator).

2.3.25 GPIOs (general-purpose inputs/outputs)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high current-capable except for analog inputs.

The I/Os alternate function configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

I/Os on APB2 with up to 18 MHz toggling speed

2.3.26 ADC (analog to digital converter)

Three 12-bit analog-to-digital converters are embedded into STM32F103xC, STM32F103xD and STM32F103xE performance line devices and each ADC shares up to 21 external channels, performing conversions in single-shot or scan modes. In scan mode, automatic conversion is performed on a selected group of analog inputs.

Additional logic functions embedded in the ADC interface allow:

- Simultaneous sample and hold
- Interleaved sample and hold
- Single shunt

The ADC can be served by the DMA controller.

An analog watchdog feature allows very precise monitoring of the converted voltage of one, some or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

The events generated by the general-purpose timers (TIMx) and the advanced-control timers (TIM1 and TIM8) can be internally connected to the ADC start trigger and injection trigger, respectively, to allow the application to synchronize A/D conversion and timers.

2.3.27 DAC (digital-to-analog converter)

The two 12-bit buffered DAC channels can be used to convert two digital signals into two analog voltage signal outputs. The chosen design structure is composed of integrated resistor strings and an amplifier in inverting configuration.

This dual digital Interface supports the following features:

- two DAC converters: one for each output channel
- 8-bit or 12-bit monotonic output
- left or right data alignment in 12-bit mode
- synchronized update capability
- noise-wave generation
- triangular-wave generation
- dual DAC channel independent or simultaneous conversions
- DMA capability for each channel
- external triggers for conversion
- input voltage reference V_{REF+}

Eight DAC trigger inputs are used in the STM32F103xC, STM32F103xD and STM32F103xE performance line family. The DAC channels are triggered through the timer update outputs that are also connected to different DMA channels.

2.3.28 Temperature sensor

The temperature sensor has to generate a voltage that varies linearly with temperature. The conversion range is between $2\text{ V} < V_{DDA} < 3.6\text{ V}$. The temperature sensor is internally connected to the ADC1_IN16 input channel which is used to convert the sensor output voltage into a digital value.

2.3.29 Serial wire JTAG debug port (SWJ-DP)

The ARM SWJ-DP Interface is embedded, and is a combined JTAG and serial wire debug port that enables either a serial wire debug or a JTAG probe to be connected to the target. The JTAG TMS and TCK pins are shared respectively with SWDIO and SWCLK and a specific sequence on the TMS pin is used to switch between JTAG-DP and SW-DP.

2.3.30 Embedded Trace Macrocell™

The ARM® Embedded Trace Macrocell provides a greater visibility of the instruction and data flow inside the CPU core by streaming compressed data at a very high rate from the STM32F10xxx through a small number of ETM pins to an external hardware trace port analyzer (TPA) device. The TPA is connected to a host computer using USB, Ethernet, or any other high-speed channel. Real-time instruction and data flow activity can be recorded and then formatted for display on the host computer running debugger software. TPA hardware is commercially available from common development tool vendors. It operates with third party debugger software tools.

| F5 | F5 | A8 | 64 | 100 | 144 | V _{DD_3} | S | | V _{DD_3} | | |

1. I = input, O = output, S = supply.

2. FT = 5 V tolerant.

3. Function availability depends on the chosen device.

4. If several peripherals share the same I/O pin, to avoid conflict between these alternate functions only one peripheral should be enabled at a time through the peripheral clock enable bit (in the corresponding RCC peripheral clock enable register).

5. PC13, PC14 and PC15 are supplied through the power switch. Since the switch only sinks a limited amount of current (3 mA), the use of GPIOs PC13 to PC15 in output mode is limited: the speed should not exceed 2 MHz with a maximum load of 30 pF and these IOs must not be used as a current source (e.g. to drive an LED).

6. Main function after the first backup domain power-up. Later on, it depends on the contents of the Backup registers even after reset (because these registers are not reset by the main reset). For details on how to manage these IOs, refer to the Battery backup domain and BKP register description sections in the STM32F10xxx reference manual, available from the STMicroelectronics website: www.st.com.

7. Unlike in the LQFP64 package, there is no PC3 in the WLCSP package. The V_{REF+} functionality is provided instead.

8. This alternate function can be remapped by software to some other port pins (if available on the used package). For more details, refer to the Alternate function I/O and debug configuration section in the STM32F10xxx reference manual, available from the STMicroelectronics website: www.st.com.

9. For the LQFP64 package, the pins number 5 and 6 are configured as OSC_IN/OSC_OUT after reset, however the functionality of PD0 and PD1 can be remapped by software on these pins. For the LQFP100/BGA100 and LQFP144/BGA144 packages, PD0 and PD1 are available by default, so there is no need for remapping. For more details, refer to Alternate function I/O and debug configuration section in the STM32F10xxx reference manual.

10. For devices delivered in LQFP64 packages, the FSMC function is not available.

1. Ports F and G are not available in devices delivered in 100-pin packages.

4 Memory mapping

The memory map is shown in *Figure 9*.

Figure 9. Memory map

5 Electrical characteristics

5.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to V_{SS} .

5.1.1 Minimum and maximum values

Unless otherwise specified the minimum and maximum values are guaranteed in the worst conditions of ambient temperature, supply voltage and frequencies by tests in production on 100% of the devices with an ambient temperature at $T_A = 25\text{ }^\circ\text{C}$ and $T_A = T_{A\text{max}}$ (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation ($\text{mean} \pm 3\Sigma$).

5.1.2 Typical values

Unless otherwise specified, typical data are based on $T_A = 25\text{ }^\circ\text{C}$, $V_{DD} = 3.3\text{ V}$ (for the $2\text{ V} \leq V_{DD} \leq 3.6\text{ V}$ voltage range). They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated ($\text{mean} \pm 2\Sigma$).

5.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

5.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in [Figure 10](#).

5.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in [Figure 11](#).

Figure 10. Pin loading conditions

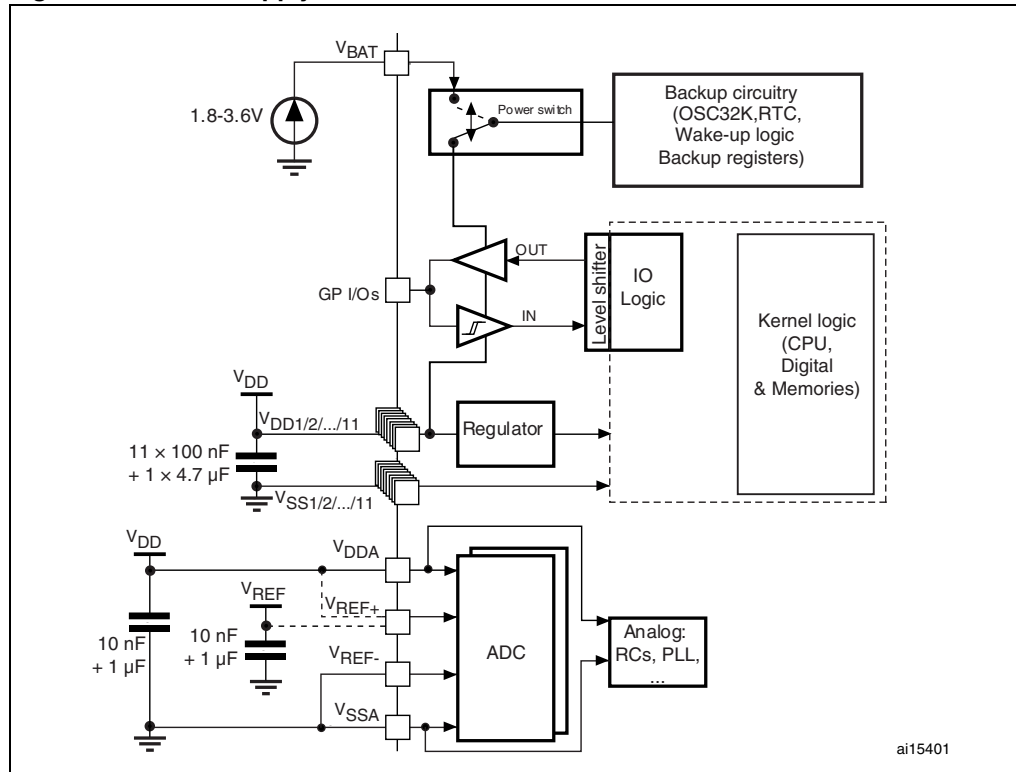

Figure 11. Pin input voltage

5.1.6 Power supply scheme

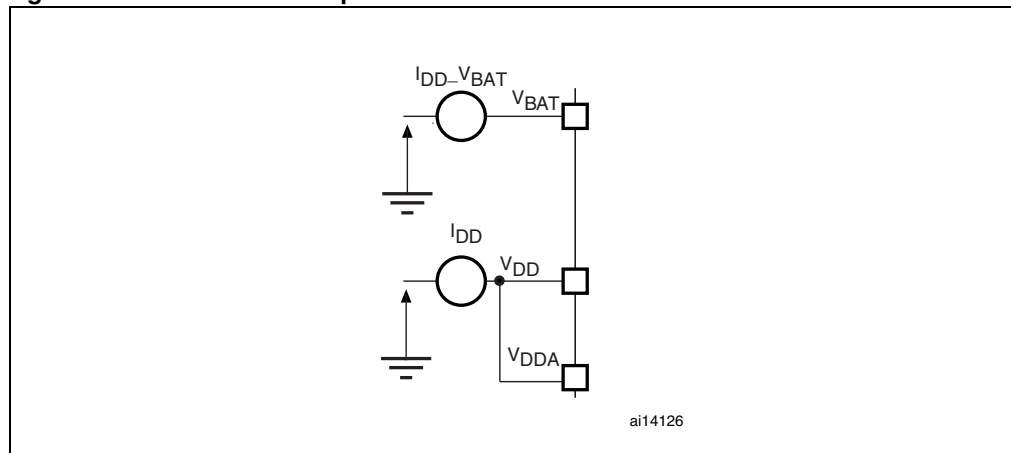

Figure 12. Power supply scheme

Caution: In [Figure 12](#), the 4.7 μF capacitor must be connected to V_{DD3}.

5.1.7 Current consumption measurement

Figure 13. Current consumption measurement scheme

5.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in [Table 7: Voltage characteristics](#), [Table 8: Current characteristics](#), and [Table 9: Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 7. Voltage characteristics

| Symbol | Ratings | Min | Max | Unit |
|----------------------|---|---|--------------|------|
| $V_{DD}-V_{SS}$ | External main supply voltage (including V_{DDA} and V_{DD}) ⁽¹⁾ | -0.3 | 4.0 | V |
| V_{IN} | Input voltage on five volt tolerant pin ⁽²⁾ | $V_{SS} - 0.3$ | +5.5 | |
| | Input voltage on any other pin ⁽²⁾ | $V_{SS} - 0.3$ | $V_{DD}+0.3$ | |
| $ \Delta V_{DDx} $ | Variations between different V_{DD} power pins | | 50 | mV |
| $ V_{SSx} - V_{SS} $ | Variations between all the different ground pins | | 50 | |
| $V_{ESD(HBM)}$ | Electrostatic discharge voltage (human body model) | see Section 5.3.12: Absolute maximum ratings (electrical sensitivity) | | |

- All main power (V_{DD} , V_{DDA}) and ground (V_{SS} , V_{SSA}) pins must always be connected to the external power supply, in the permitted range.
- $I_{INJ(PIN)}$ must never be exceeded (see [Table 8: Current characteristics](#)). This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{INmax}$ while a negative injection is induced by $V_{IN} < V_{SS}$.

Table 8. Current characteristics

| Symbol | Ratings | Max. | Unit |
|--------------------------------------|---|------|------|
| I_{VDD} | Total current into V_{DD}/V_{DDA} power lines (source) ⁽¹⁾ | 150 | mA |
| I_{VSS} | Total current out of V_{SS} ground lines (sink) ⁽¹⁾ | 150 | |
| I_{IO} | Output current sunk by any I/O and control pin | 25 | |
| | Output current source by any I/Os and control pin | - 25 | |
| $I_{INJ(PIN)}$ ⁽²⁾⁽³⁾ | Injected current on NRST pin | ± 5 | |
| | Injected current on HSE OSC_IN and LSE OSC_IN pins | ± 5 | |
| | Injected current on any other pin ⁽⁴⁾ | ± 5 | |
| $\Sigma I_{INJ(PIN)}$ ⁽²⁾ | Total injected current (sum of all I/O and control pins) ⁽⁴⁾ | ± 25 | |

- All main power (V_{DD} , V_{DDA}) and ground (V_{SS} , V_{SSA}) pins must always be connected to the external power supply, in the permitted range.
- $I_{INJ(PIN)}$ must never be exceeded. This is implicitly insured if V_{IN} maximum is respected. If V_{IN} maximum cannot be respected, the injection current must be limited externally to the $I_{INJ(PIN)}$ value. A positive injection is induced by $V_{IN} > V_{DD}$ while a negative injection is induced by $V_{IN} < V_{SS}$.
- Negative injection disturbs the analog performance of the device. See note in [Section 5.3.18: 12-bit ADC characteristics](#).
- When several inputs are submitted to a current injection, the maximum $\Sigma I_{INJ(PIN)}$ is the absolute sum of the positive and negative injected currents (instantaneous values). These results are based on characterization with $\Sigma I_{INJ(PIN)}$ maximum current injection on four I/O port pins of the device.

Table 9. Thermal characteristics

| Symbol | Ratings | Value | Unit |
|-----------|------------------------------|-------------|------|
| T_{STG} | Storage temperature range | -65 to +150 | °C |
| T_J | Maximum junction temperature | 150 | °C |

5.3 Operating conditions

5.3.1 General operating conditions

Table 10. General operating conditions

| Symbol | Parameter | Conditions | Min | Max | Unit |
|-----------------|---|--|-----|-----|------|
| f_{HCLK} | Internal AHB clock frequency | | 0 | 72 | MHz |
| f_{PCLK1} | Internal APB1 clock frequency | | 0 | 36 | |
| f_{PCLK2} | Internal APB2 clock frequency | | 0 | 72 | |
| V_{DD} | Standard operating voltage | | 2 | 3.6 | V |
| $V_{DDA}^{(1)}$ | Analog operating voltage (ADC not used) | Must be the same potential as $V_{DD}^{(2)}$ | 2 | 3.6 | V |
| | Analog operating voltage (ADC used) | | 2.4 | 3.6 | |
| V_{BAT} | Backup operating voltage | | 1.8 | 3.6 | V |
| P_D | Power dissipation at $T_A = 85\text{ °C}$ for suffix 6 or $T_A = 105\text{ °C}$ for suffix 7 ⁽³⁾ | LQFP144 | | 666 | mW |
| | | LQFP100 | | 434 | |
| | | LQFP64 | | 444 | |
| | | LFPGA100 | | 500 | |
| | | LFPGA144 | | 500 | |
| T_A | Ambient temperature for 6 suffix version | Maximum power dissipation | -40 | 85 | °C |
| | | Low power dissipation ⁽⁴⁾ | -40 | 105 | |
| | Ambient temperature for 7 suffix version | Maximum power dissipation | -40 | 105 | °C |
| | | Low power dissipation ⁽⁴⁾ | -40 | 125 | |
| T_J | Junction temperature range | 6 suffix version | -40 | 105 | °C |
| | | 7 suffix version | -40 | 125 | |

- When the ADC is used, refer to [Table 58: ADC characteristics](#).
- It is recommended to power V_{DD} and V_{DDA} from the same source. A maximum difference of 300 mV between V_{DD} and V_{DDA} can be tolerated during power-up and operation.
- If T_A is lower, higher P_D values are allowed as long as T_J does not exceed T_{Jmax} (see [Table 6.2: Thermal characteristics on page 114](#)).
- In low power dissipation state, T_A can be extended to this range as long as T_J does not exceed T_{Jmax} (see [Table 6.2: Thermal characteristics on page 114](#)).

5.3.2 Operating conditions at power-up / power-down

The parameters given in [Table 11](#) are derived from tests performed under the ambient temperature condition summarized in [Table 10](#).

Table 11. Operating conditions at power-up / power-down

| Symbol | Parameter | Conditions | Min | Max | Unit |
|-----------|-------------------------|------------|-----|----------|-----------------|
| t_{VDD} | V_{DD} rise time rate | | 0 | ∞ | $\mu\text{s/V}$ |
| | V_{DD} fall time rate | | 20 | ∞ | |

5.3.3 Embedded reset and power control block characteristics

The parameters given in [Table 12](#) are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in [Table 10](#).

Table 12. Embedded reset and power control block characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|-----------------------------|---|-----------------------------|--------------------|------|------|------|
| V_{PVD} | Programmable voltage detector level selection | PLS[2:0]=000 (rising edge) | 2.1 | 2.18 | 2.26 | V |
| | | PLS[2:0]=000 (falling edge) | 2 | 2.08 | 2.16 | V |
| | | PLS[2:0]=001 (rising edge) | 2.19 | 2.28 | 2.37 | V |
| | | PLS[2:0]=001 (falling edge) | 2.09 | 2.18 | 2.27 | V |
| | | PLS[2:0]=010 (rising edge) | 2.28 | 2.38 | 2.48 | V |
| | | PLS[2:0]=010 (falling edge) | 2.18 | 2.28 | 2.38 | V |
| | | PLS[2:0]=011 (rising edge) | 2.38 | 2.48 | 2.58 | V |
| | | PLS[2:0]=011 (falling edge) | 2.28 | 2.38 | 2.48 | V |
| | | PLS[2:0]=100 (rising edge) | 2.47 | 2.58 | 2.69 | V |
| | | PLS[2:0]=100 (falling edge) | 2.37 | 2.48 | 2.59 | V |
| | | PLS[2:0]=101 (rising edge) | 2.57 | 2.68 | 2.79 | V |
| | | PLS[2:0]=101 (falling edge) | 2.47 | 2.58 | 2.69 | V |
| | | PLS[2:0]=110 (rising edge) | 2.66 | 2.78 | 2.9 | V |
| | | PLS[2:0]=110 (falling edge) | 2.56 | 2.68 | 2.8 | V |
| PLS[2:0]=111 (rising edge) | 2.76 | 2.88 | 3 | V | | |
| PLS[2:0]=111 (falling edge) | 2.66 | 2.78 | 2.9 | V | | |
| $V_{PVDhyst}^{(2)}$ | PVD hysteresis | | | 100 | | mV |
| $V_{POR/PDR}$ | Power on/power down reset threshold | Falling edge | 1.8 ⁽¹⁾ | 1.88 | 1.96 | V |
| | | Rising edge | 1.84 | 1.92 | 2.0 | V |
| $V_{PDRhyst}^{(2)}$ | PDR hysteresis | | | 40 | | mV |
| $T_{RSTTEMPO}^{(2)}$ | Reset temporization | | 1 | 2.5 | 4.5 | mS |

1. The product behavior is guaranteed by design down to the minimum $V_{POR/PDR}$ value.

2. Guaranteed by design, not tested in production.

5.3.4 Embedded reference voltage

The parameters given in [Table 13](#) are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in [Table 10](#).

Table 13. Embedded internal reference voltage

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|------------------------|---|--|------|------|---------------------|-------------------------|
| V_{REFINT} | Internal reference voltage | $-40\text{ }^{\circ}\text{C} < T_A < +105\text{ }^{\circ}\text{C}$ | 1.16 | 1.20 | 1.26 | V |
| | | $-40\text{ }^{\circ}\text{C} < T_A < +85\text{ }^{\circ}\text{C}$ | 1.16 | 1.20 | 1.24 | V |
| $T_{S_vrefint}^{(1)}$ | ADC sampling time when reading the internal reference voltage | | | 5.1 | 17.1 ⁽²⁾ | μs |
| $V_{RERINT}^{(2)}$ | Internal reference voltage spread over the temperature range | $V_{DD} = 3\text{ V} \pm 10\text{ mV}$ | | | 10 | mV |
| $T_{Coef}^{(2)}$ | Temperature coefficient | | | | 100 | ppm/ $^{\circ}\text{C}$ |

1. Shortest sampling time can be determined in the application by multiple iterations.
2. Guaranteed by design, not tested in production.

5.3.5 Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in [Figure 13: Current consumption measurement scheme](#).

All Run-mode current consumption measurements given in this section are performed with a reduced code that gives a consumption equivalent to Dhrystone 2.1 code.

Maximum current consumption

The MCU is placed under the following conditions:

- All I/O pins are in input mode with a static value at V_{DD} or V_{SS} (no load)
- All peripherals are disabled except when explicitly mentioned
- The Flash memory access time is adjusted to the f_{HCLK} frequency (0 wait state from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states above)
- Prefetch in ON (reminder: this bit must be set before clock setting and bus prescaling)
- When the peripherals are enabled $f_{PCLK1} = f_{HCLK}/2$, $f_{PCLK2} = f_{HCLK}$

The parameters given in [Table 14](#), [Table 15](#) and [Table 16](#) are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in [Table 10](#).

Table 14. Maximum current consumption in Run mode, code with data processing running from Flash

| Symbol | Parameter | Conditions | f _{HCLK} | Max ⁽¹⁾ | | Unit |
|-----------------|----------------------------|--|-------------------|------------------------|-------------------------|------|
| | | | | T _A = 85 °C | T _A = 105 °C | |
| I _{DD} | Supply current in Run mode | External clock ⁽²⁾ , all peripherals enabled | 72 MHz | 69 | 70 | mA |
| | | | 48 MHz | 50 | 50.5 | |
| | | | 36 MHz | 39 | 39.5 | |
| | | | 24 MHz | 27 | 28 | |
| | | | 16 MHz | 20 | 20.5 | |
| | | | 8 MHz | 11 | 11.5 | |
| | | External clock ⁽²⁾ , all peripherals disabled | 72 MHz | 37 | 37.5 | |
| | | | 48 MHz | 28 | 28.5 | |
| | | | 36 MHz | 22 | 22.5 | |
| | | | 24 MHz | 16.5 | 17 | |
| | | | 16 MHz | 12.5 | 13 | |
| | | | 8 MHz | 8 | 8 | |

1. Based on characterization, not tested in production.

2. External clock is 8 MHz and PLL is on when f_{HCLK} > 8 MHz.

Table 15. Maximum current consumption in Run mode, code with data processing running from RAM

| Symbol | Parameter | Conditions | f _{HCLK} | Max ⁽¹⁾ | | Unit |
|-----------------|----------------------------|--|-------------------|------------------------|-------------------------|------|
| | | | | T _A = 85 °C | T _A = 105 °C | |
| I _{DD} | Supply current in Run mode | External clock ⁽²⁾ , all peripherals enabled | 72 MHz | 66 | 67 | mA |
| | | | 48 MHz | 43.5 | 45.5 | |
| | | | 36 MHz | 33 | 35 | |
| | | | 24 MHz | 23 | 24.5 | |
| | | | 16 MHz | 16 | 18 | |
| | | | 8 MHz | 9 | 10.5 | |
| | | External clock ⁽²⁾ , all peripherals disabled | 72 MHz | 33 | 33.5 | |
| | | | 48 MHz | 23 | 23.5 | |
| | | | 36 MHz | 18 | 18.5 | |
| | | | 24 MHz | 13 | 13.5 | |
| | | | 16 MHz | 10 | 10.5 | |
| | | | 8 MHz | 6 | 6.5 | |

1. Data based on characterization results, tested in production at V_{DD} max, f_{HCLK} max.

2. External clock is 8 MHz and PLL is on when f_{HCLK} > 8 MHz.

Figure 14. Typical current consumption in Run mode versus frequency (at 3.6 V) - code with data processing running from RAM, peripherals enabled

| | | | 24 MHz | 5 | 5.5 | |
| | | | 16 MHz | 4.5 | 5 | |
| | | | 8 MHz | 4 | 4 | |

1. Based on characterization, tested in production at V_{DD} max, f_{HCLK} max with peripherals enabled.

2. External clock is 8 MHz and PLL is on when $f_{\text{HCLK}} > 8$ MHz.

Table 17. Typical and maximum current consumptions in Stop and Standby modes

| Symbol | Parameter | Conditions | Typ ⁽¹⁾ | | | Max | | Unit |
|----------------------|--------------------------------|---|---|---|---|------------------------|-------------------------|------|
| | | | V _{DD} /V _{BAT} = 2.0 V | V _{DD} /V _{BAT} = 2.4 V | V _{DD} /V _{BAT} = 3.3 V | T _A = 85 °C | T _A = 105 °C | |
| I _{DD} | Supply current in Stop mode | Regulator in run mode, low-speed and high-speed internal RC oscillators and high-speed oscillator OFF (no independent watchdog) | | 34.5 | 35 | 379 | 1130 | μA |
| | | Regulator in low-power mode, low-speed and high-speed internal RC oscillators and high-speed oscillator OFF (no independent watchdog) | | 24.5 | 25 | 365 | 1110 | |
| | Supply current in Standby mode | Low-speed internal RC oscillator and independent watchdog ON | | 3 | 3.8 | - | - | |
| | | Low-speed internal RC oscillator ON, independent watchdog OFF | | 2.8 | 3.6 | - | - | |
| | | Low-speed internal RC oscillator and independent watchdog OFF, low-speed oscillator and RTC OFF | | 1.9 | 2.1 | 5 ⁽²⁾ | 6.5 ⁽²⁾ | |
| I _{DD_VBAT} | Backup domain supply current | Low-speed oscillator and RTC ON | 1.05 | 1.1 | 1.4 | 2 ⁽²⁾ | 2.3 ⁽²⁾ | |

1. Typical values are measured at T_A = 25 °C.
2. Based on characterization, not tested in production.

Figure 16. Typical current consumption on V_{BAT} with RTC on vs. temperature at different V_{BAT} values

Figure 17. Typical current consumption in Stop mode with regulator in run mode versus temperature at different V_{DD} values

Figure 18. Typical current consumption in Stop mode with regulator in low-power mode versus temperature at different V_{DD} values

Figure 19. Typical current consumption in Standby mode versus temperature at different V_{DD} values

Typical current consumption

The MCU is placed under the following conditions:

- All I/O pins are in input mode with a static value at V_{DD} or V_{SS} (no load).
- All peripherals are disabled except if it is explicitly mentioned.
- The Flash access time is adjusted to f_{HCLK} frequency (0 wait state from 0 to 24 MHz, 1 wait state from 24 to 48 MHz and 2 wait states above).
- Ambient temperature and V_{DD} supply voltage conditions summarized in [Table 10](#).
- Prefetch is ON (Reminder: this bit must be set before clock setting and bus prescaling)

When the peripherals are enabled $f_{PCLK1} = f_{HCLK}/4$, $f_{PCLK2} = f_{HCLK}/2$, $f_{ADCCLK} = f_{PCLK2}/4$

Table 18. Typical current consumption in Run mode, code with data processing running from Flash

| Symbol | Parameter | Conditions | f _{HCLK} | Typ ⁽¹⁾ | | Unit |
|-----------------|----------------------------|---|-------------------|--|--------------------------|------|
| | | | | All peripherals enabled ⁽²⁾ | All peripherals disabled | |
| I _{DD} | Supply current in Run mode | External clock ⁽³⁾ | 72 MHz | 51 | 30.5 | mA |
| | | | 48 MHz | 34.6 | 20.7 | |
| | | | 36 MHz | 26.6 | 16.2 | |
| | | | 24 MHz | 18.5 | 11.4 | |
| | | | 16 MHz | 12.8 | 8.2 | |
| | | | 8 MHz | 7.2 | 5 | |
| | | | 4 MHz | 4.2 | 3.1 | |
| | | | 2 MHz | 2.7 | 2.1 | |
| | | | 1 MHz | 2 | 1.7 | |
| | | | 500 kHz | 1.6 | 1.4 | |
| | | 125 kHz | 1.3 | 1.2 | | |
| | | Running on high speed internal RC (HSI), AHB prescaler used to reduce the frequency | 64 MHz | 45 | 27 | mA |
| | | | 48 MHz | 34 | 20.1 | |
| | | | 36 MHz | 26 | 15.6 | |
| | | | 24 MHz | 17.9 | 10.8 | |
| | | | 16 MHz | 12.2 | 7.6 | |
| | | | 8 MHz | 6.6 | 4.4 | |
| | | | 4 MHz | 3.6 | 2.5 | |
| | | | 2 MHz | 2.1 | 1.5 | |
| | | | 1 MHz | 1.4 | 1.1 | |
| 500 kHz | 1 | | 0.8 | | | |
| 125 kHz | 0.7 | 0.6 | | | | |

1. Typical values are measures at T_A = 25 °C, V_{DD} = 3.3 V.
2. Add an additional power consumption of 0.8 mA per ADC for the analog part. In applications, this consumption occurs only while the ADC is on (ADON bit is set in the ADC_CR2 register).
3. External clock is 8 MHz and PLL is on when f_{HCLK} > 8 MHz.

Table 19. Typical current consumption in Sleep mode, coderunning from Flash or RAM

| Symbol | Parameter | Conditions | f _{HCLK} | Typ ⁽¹⁾ | | Unit |
|-----------------|------------------------------|---|-------------------|--|--------------------------|------|
| | | | | All peripherals enabled ⁽²⁾ | All peripherals disabled | |
| I _{DD} | Supply current in Sleep mode | External clock ⁽³⁾ | 72 MHz | 29.5 | 6.4 | mA |
| | | | 48 MHz | 20 | 4.6 | |
| | | | 36 MHz | 15.1 | 3.6 | |
| | | | 24 MHz | 10.4 | 2.6 | |
| | | | 16 MHz | 7.2 | 2 | |
| | | | 8 MHz | 3.9 | 1.3 | |
| | | | 4 MHz | 2.6 | 1.2 | |
| | | | 2 MHz | 1.85 | 1.15 | |
| | | | 1 MHz | 1.5 | 1.1 | |
| | | | 500 kHz | 1.3 | 1.05 | |
| | | 125 kHz | 1.2 | 1.05 | | |
| | | Running on high speed internal RC (HSI), AHB prescaler used to reduce the frequency | 64 MHz | 25.6 | 5.1 | |
| | | | 48 MHz | 19.4 | 4 | |
| | | | 36 MHz | 14.5 | 3 | |
| | | | 24 MHz | 9.8 | 2 | |
| | | | 16 MHz | 6.6 | 1.4 | |
| | | | 8 MHz | 3.3 | 0.7 | |
| | | | 4 MHz | 2 | 0.6 | |
| | | | 2 MHz | 1.25 | 0.55 | |
| | | | 1 MHz | 0.9 | 0.5 | |
| 500 kHz | 0.7 | | 0.45 | | | |
| 125 kHz | 0.6 | 0.45 | | | | |

1. Typical values are measures at T_A = 25 °C, V_{DD} = 3.3 V.
2. Add an additional power consumption of 0.8 mA per ADC for the analog part. In applications, this consumption occurs only while the ADC is on (ADON bit is set in the ADC_CR2 register).
3. External clock is 8 MHz and PLL is on when f_{HCLK} > 8 MHz.

On-chip peripheral current consumption

The current consumption of the on-chip peripherals is given in [Table 20](#). The MCU is placed under the following conditions:

- all I/O pins are in input mode with a static value at V_{DD} or V_{SS} (no load)
- all peripherals are disabled unless otherwise mentioned
- the given value is calculated by measuring the current consumption
 - with all peripherals clocked off
 - with only one peripheral clocked on
- ambient operating temperature and V_{DD} supply voltage conditions summarized in [Table 7](#)

Table 20. Peripheral current consumption⁽¹⁾

| Peripheral | | Typical consumption at 25 °C | Unit |
|------------|--------|------------------------------|------|
| APB1 | TIM2 | 1.2 | mA |
| | TIM3 | 1.2 | |
| | TIM4 | 1.2 | |
| | TIM5 | 1.2 | |
| | TIM6 | 0.4 | |
| | TIM7 | 0.4 | |
| | SPI2 | 0.2 | |
| | SPI3 | 0.2 | |
| | USART2 | 0.4 | |
| | USART3 | 0.4 | |
| | UART4 | 0.5 | |
| | UART5 | 0.6 | |
| | I2C1 | 0.4 | |
| | I2C2 | 0.4 | |
| | USB | 0.65 | |
| | CAN | 0.72 | |
| DAC | 0.72 | | |

Table 20. Peripheral current consumption⁽¹⁾ (continued)

| Peripheral | | Typical consumption at 25 °C | Unit |
|------------|---------------------|------------------------------|------|
| APB2 | GPIOA | 0.55 | mA |
| | GPIOB | 0.72 | |
| | GPIOC | 0.72 | |
| | GIOD | 0.55 | |
| | GPIOE | 1 | |
| | GPIOF | 0.72 | |
| | GPIOG | 1 | |
| | ADC1 ⁽²⁾ | 1.9 | |
| | ADC2 | 1.7 | |
| | TIM1 | 1.8 | |
| | SPI1 | 0.4 | |
| | TIM8 | 1.7 | |
| | USART1 | 0.9 | |
| | ADC3 | 1.7 | |

1. $f_{HCLK} = 72 \text{ MHz}$, $f_{APB1} = f_{HCLK}/2$, $f_{APB2} = f_{HCLK}$, default prescaler value for each peripheral.

2. Specific conditions for ADC: $f_{HCLK} = 56 \text{ MHz}$, $f_{APB1} = f_{HCLK}/2$, $f_{APB2} = f_{HCLK}$, $f_{ADCCLK} = f_{APB2}/4$, ADON bit in the ADC_CR2 register is set to 1.

5.3.6 External clock source characteristics

High-speed external user clock generated from an external source

The characteristics given in [Table 21](#) result from tests performed using an high-speed external clock source, and under ambient temperature and supply voltage conditions summarized in [Table 10](#).

Table 21. High-speed external user clock characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|------------------------------|---|----------------------------------|-------------|-----|-------------|---------------|
| f_{HSE_ext} | User external clock source frequency ⁽¹⁾ | | 1 | 8 | 25 | MHz |
| V_{HSEH} | OSC_IN input pin high level voltage | | $0.7V_{DD}$ | | V_{DD} | V |
| V_{HSEL} | OSC_IN input pin low level voltage | | V_{SS} | | $0.3V_{DD}$ | |
| $t_{w(HSE)}$ $t_{w(HSE)}$ | OSC_IN high or low time ⁽¹⁾ | | 16 | | | ns |
| $t_{r(HSE)}$ $t_{f(HSE)}$ | OSC_IN rise or fall time ⁽¹⁾ | | | | 20 | |
| $C_{in(HSE)}$ | OSC_IN input capacitance ⁽¹⁾ | | | 5 | | pF |
| $DuCy_{(HSE)}$ | Duty cycle | | 45 | | 55 | % |
| I_L | OSC_IN Input leakage current | $V_{SS} \leq V_{IN} \leq V_{DD}$ | | | ± 1 | μA |

1. Guaranteed by design, not tested in production.

Low-speed external user clock generated from an external source

The characteristics given in [Table 22](#) result from tests performed using a low-speed external clock source, and under ambient temperature and supply voltage conditions summarized in [Table 10](#).

Table 22. Low-speed external user clock characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|------------------------------|---|-------------------------------|-------------|--------|-------------|---------|
| f_{LSE_ext} | User External clock source frequency ⁽¹⁾ | | | 32.768 | 1000 | kHz |
| V_{LSEH} | OSC32_IN input pin high level voltage | | $0.7V_{DD}$ | | V_{DD} | V |
| V_{LSEL} | OSC32_IN input pin low level voltage | | V_{SS} | | $0.3V_{DD}$ | |
| $t_{w(LSE)}$ $t_{w(LSE)}$ | OSC32_IN high or low time ⁽¹⁾ | | 450 | | | ns |
| $t_{r(LSE)}$ $t_{f(LSE)}$ | OSC32_IN rise or fall time ⁽¹⁾ | | | | 50 | |
| $C_{in(LSE)}$ | OSC32_IN input capacitance ⁽¹⁾ | | | 5 | | pF |
| $DuCy_{(LSE)}$ | Duty cycle | | 30 | | 70 | % |

1. Guaranteed by design, not tested in production.

Figure 20. High-speed external clock source AC timing diagram

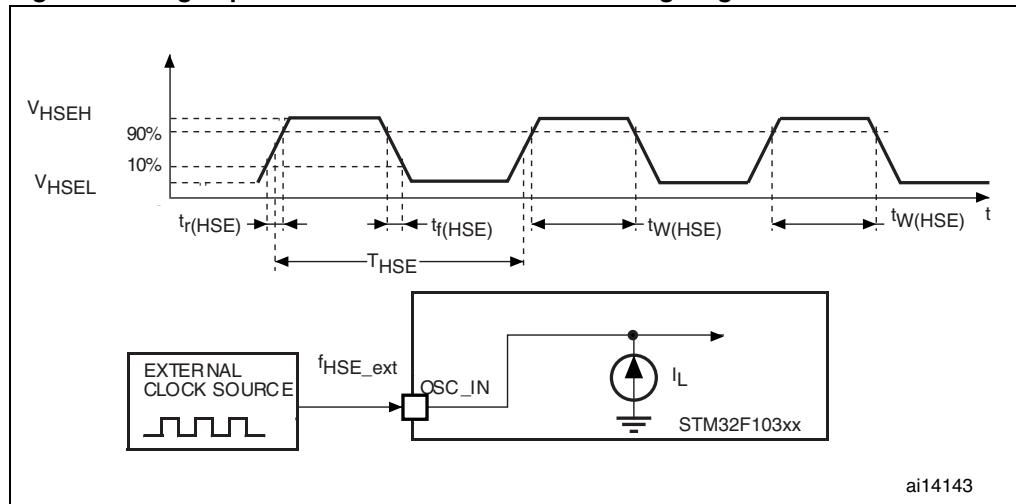

Figure 21. Low-speed external clock source AC timing diagram

High-speed external clock generated from a crystal/ceramic resonator

The high-speed external (HSE) clock can be supplied with a 4 to 16 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in [Table 23](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 23. HSE 4-16 MHz oscillator characteristics⁽¹⁾⁽²⁾

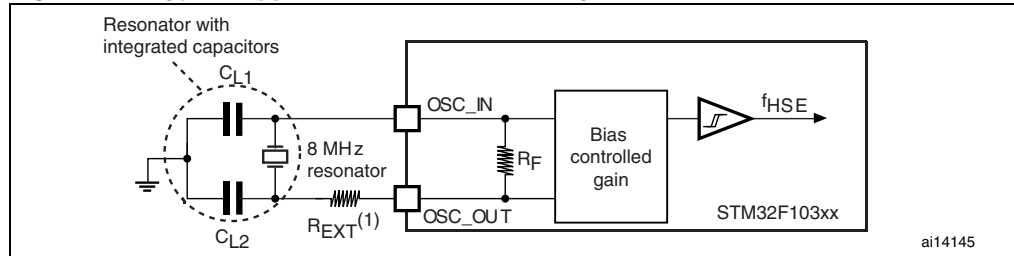

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|------------------------------|--|---|-----|-----|-----|------------|
| f_{OSC_IN} | Oscillator frequency | | 4 | 8 | 16 | MHz |
| R_F | Feedback resistor | | | 200 | | k Ω |
| C | Recommended load capacitance versus equivalent serial resistance of the crystal (R_S) ⁽³⁾ | $R_S = 30 \Omega$ | | 30 | | pF |
| i_2 | HSE driving current | $V_{DD} = 3.3 V$, $V_{IN} = V_{SS}$ with 30 pF load | | | 1 | mA |
| g_m | Oscillator transconductance | Startup | 25 | | | mA/V |
| $t_{SU(HSE)}$ ⁽⁴⁾ | Startup time | V_{DD} is stabilized | | 2 | | ms |

1. Resonator characteristics given by the crystal/ceramic resonator manufacturer.
2. Based on characterization results, not tested in production.
3. The relatively low value of the RF resistor offers a good protection against issues resulting from use in a humid environment, due to the induced leakage and the bias condition change. However, it is recommended to take this point into account if the MCU is used in tough humidity conditions.
4. $t_{SU(HSE)}$ is the startup time measured from the moment it is enabled (by software) to a stabilized 8 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer

For C_{L1} and C_{L2} , it is recommended to use high-quality external ceramic capacitors in the 5 pF to 25 pF range (typ.), designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see [Figure 22](#)). C_{L1} and C_{L2} are usually the

same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of C_{L1} and C_{L2} . PCB and MCU pin capacitance must be included (10 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing C_{L1} and C_{L2} . Refer to the application note AN2867 “Oscillator design guide for ST microcontrollers” available from the ST website www.st.com.

Figure 22. Typical application with an 8 MHz crystal

1. R_{EXT} value depends on the crystal characteristics.

Low-speed external clock generated from a crystal/ceramic resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in [Table 24](#). In the application, the resonator and the load capacitors have to be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 24. LSE oscillator characteristics ($f_{LSE} = 32.768$ kHz)⁽¹⁾

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|---------------------|--|-------------------------------------|-----|-----|-----|------------|
| R_F | Feedback resistor | | | 5 | | M Ω |
| $C^{(2)}$ | Recommended load capacitance versus equivalent serial resistance of the crystal (R_S) ⁽³⁾ | $R_S = 30$ k Ω | | | 15 | pF |
| I_2 | LSE driving current | $V_{DD} = 3.3$ V, $V_{IN} = V_{SS}$ | | | 1.4 | μ A |
| g_m | Oscillator transconductance | | 5 | | | μ A/V |
| $t_{SU(LSE)}^{(4)}$ | Startup time | V_{DD} is stabilized | | 3 | | s |

- Based on characterization, not tested in production.
- Refer to the note and caution paragraphs below the table, and to the application note AN2867 “Oscillator design guide for ST microcontrollers”.
- The oscillator selection can be optimized in terms of supply current using an high quality resonator with small R_S value for example MSIV-TIN32.768kHz. Refer to crystal manufacturer for more details
- $t_{SU(LSE)}$ is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer

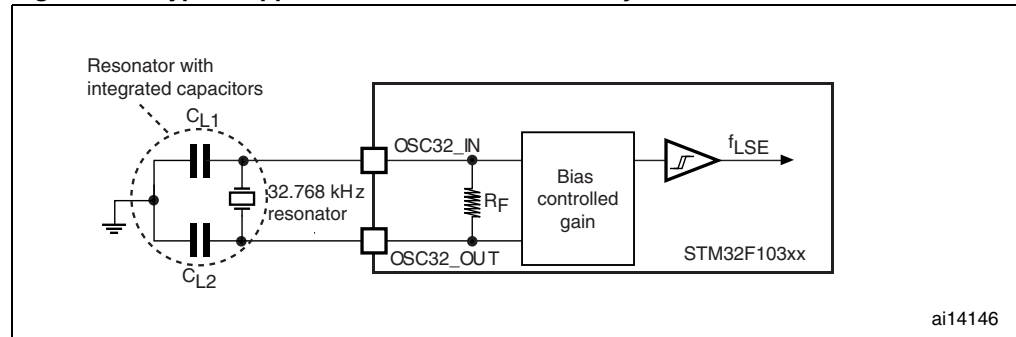

Note: For C_{L1} and C_{L2} , it is recommended to use high-quality ceramic capacitors in the 5 pF to 15 pF range selected to match the requirements of the crystal or resonator (see [Figure 23](#)). C_{L1} and C_{L2} , are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of C_{L1} and C_{L2} . Load capacitance C_L has the following formula: $C_L = C_{L1} \times C_{L2} / (C_{L1} + C_{L2}) + C_{stray}$ where

C_{stray} is the pin capacitance and board or trace PCB-related capacitance. Typically, it is between 2 pF and 7 pF.

Caution: To avoid exceeding the maximum value of C_{L1} and C_{L2} (15 pF) it is strongly recommended to use a resonator with a load capacitance $C_L \leq 7$ pF. Never use a resonator with a load capacitance of 12.5 pF.

Example: if you choose a resonator with a load capacitance of $C_L = 6$ pF, and $C_{stray} = 2$ pF, then $C_{L1} = C_{L2} = 8$ pF.

Figure 23. Typical application with a 32.768 kHz crystal

5.3.7 Internal clock source characteristics

The parameters given in [Table 25](#) are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in [Table 10](#).

High-speed internal (HSI) RC oscillator

Table 25. HSI oscillator characteristics⁽¹⁾

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|------------------------------|----------------------------------|--|-------------------------|------|------------------|------|
| f_{HSI} | Frequency | | | 8 | | MHz |
| ACC_{HSI} | Accuracy of the HSI oscillator | User-trimmed with the RCC_CR register ⁽²⁾ | | | 1 ⁽³⁾ | % |
| | | Factory-calibrated ⁽⁴⁾ | $T_A = -40$ to 105 °C | -2 | 2.5 | % |
| | | | $T_A = -10$ to 85 °C | -1.5 | 2.2 | % |
| | | | $T_A = 0$ to 70 °C | -1.3 | 2 | % |
| | $T_A = 25$ °C | -1.1 | 1.8 | % | | |
| $t_{su(HSI)}$ ⁽⁴⁾ | HSI oscillator startup time | | 1 | | 2 | μs |
| $I_{DD(HSI)}$ ⁽⁴⁾ | HSI oscillator power consumption | | | 80 | 100 | μA |

1. $V_{DD} = 3.3$ V, $T_A = -40$ to 105 °C unless otherwise specified.

2. Refer to application note AN2868 "STM32F10xxx internal RC oscillator (HSI) calibration" available from the ST website www.st.com.

3. Guaranteed by design, not tested in production.

4. Based on characterization, not tested in production.

Low-speed internal (LSI) RC oscillator

Table 26. LSI oscillator characteristics ⁽¹⁾

| Symbol | Parameter | Min | Typ | Max | Unit |
|---------------------|----------------------------------|-----|------|-----|---------|
| $f_{LSI}^{(2)}$ | Frequency | 30 | 40 | 60 | kHz |
| $t_{su(LSI)}^{(3)}$ | LSI oscillator startup time | | | 85 | μ s |
| $I_{DD(LSI)}^{(3)}$ | LSI oscillator power consumption | | 0.65 | 1.2 | μ A |

- $V_{DD} = 3$ V, $T_A = -40$ to 105 °C unless otherwise specified.
- Based on characterization, not tested in production.
- Guaranteed by design, not tested in production.

Wakeup time from low-power mode

The wakeup times given in [Table 27](#) is measured on a wakeup phase with a 8-MHz HSI RC oscillator. The clock source used to wake up the device depends from the current operating mode:

- Stop or Standby mode: the clock source is the RC oscillator
- Sleep mode: the clock source is the clock that was set before entering Sleep mode.

All timings are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in [Table 10](#).

Table 27. Low-power mode wakeup timings

| Symbol | Parameter | Typ | Unit |
|---------------------|---|-----|---------|
| $t_{WUSLEEP}^{(1)}$ | Wakeup from Sleep mode | 1.8 | μ s |
| $t_{WUSTOP}^{(1)}$ | Wakeup from Stop mode (regulator in run mode) | 3.6 | μ s |
| | Wakeup from Stop mode (regulator in low power mode) | 5.4 | |
| $t_{WUSTDBY}^{(1)}$ | Wakeup from Standby mode | 50 | μ s |

- The wakeup times are measured from the wakeup event to the point in which the user application code reads the first instruction.

5.3.8 PLL characteristics

The parameters given in [Table 28](#) are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in [Table 10](#).

Table 28. PLL characteristics

| Symbol | Parameter | Value | | | Unit |
|----------------------|--------------------------------|-------|-----|--------------------|------|
| | | Min | Typ | Max ⁽¹⁾ | |
| f _{PLL_IN} | PLL input clock ⁽²⁾ | 1 | 8.0 | 25 | MHz |
| | PLL input clock duty cycle | 40 | | 60 | % |
| f _{PLL_OUT} | PLL multiplier output clock | 16 | | 72 | MHz |
| t _{LOCK} | PLL lock time | | | 200 | μs |
| Jitter | Cycle-to-cycle jitter | | | 300 | ps |

1. Based on characterization, not tested in production.
2. Take care of using the appropriate multiplier factors so as to have PLL input clock values compatible with the range defined by f_{PLL_OUT}.

5.3.9 Memory characteristics

Flash memory

The characteristics are given at $T_A = -40$ to 105 °C unless otherwise specified.

Table 29. Flash memory characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max ⁽¹⁾ | Unit |
|--------------------|-------------------------|---|-----|------|--------------------|------|
| t _{prog} | 16-bit programming time | $T_A = -40$ to $+105$ °C | 40 | 52.5 | 70 | μs |
| t _{ERASE} | Page (2 KB) erase time | $T_A = -40$ to $+105$ °C | 20 | | 40 | ms |
| t _{ME} | Mass erase time | $T_A = -40$ to $+105$ °C | 20 | | 40 | ms |
| I _{DD} | Supply current | Read mode f _{HCLK} = 72 MHz with 2 wait states, V _{DD} = 3.3 V | | | 28 | mA |
| | | Write mode f _{HCLK} = 72 MHz, V _{DD} = 3.3 V | | | 7 | mA |
| | | Erase mode f _{HCLK} = 72 MHz, V _{DD} = 3.3 V | | | 5 | mA |
| | | Power-down mode / Halt, V _{DD} = 3.0 to 3.6 V | | | 50 | μA |
| V _{prog} | Programming voltage | | 2 | | 3.6 | V |

1. Guaranteed by design, not tested in production.

Table 30. Flash memory endurance and data retention

| Symbol | Parameter | Conditions | Value | | | Unit |
|------------------|----------------|---|--------------------|-----|-----|---------|
| | | | Min ⁽¹⁾ | Typ | Max | |
| N _{END} | Endurance | T _A = -40 to +85 °C (6 suffix versions) T _A = -40 to +105 °C (7 suffix versions) | 10 | | | kcycles |
| t _{RET} | Data retention | 1 kcycle ⁽²⁾ at T _A = 85 °C | 30 | | | Years |
| | | 1 kcycle ⁽²⁾ at T _A = 105 °C | 10 | | | |
| | | 10 kcycles ⁽²⁾ at T _A = 55 °C | 20 | | | |

1. Based on characterization not tested in production.

2. Cycling performed over the whole temperature range.

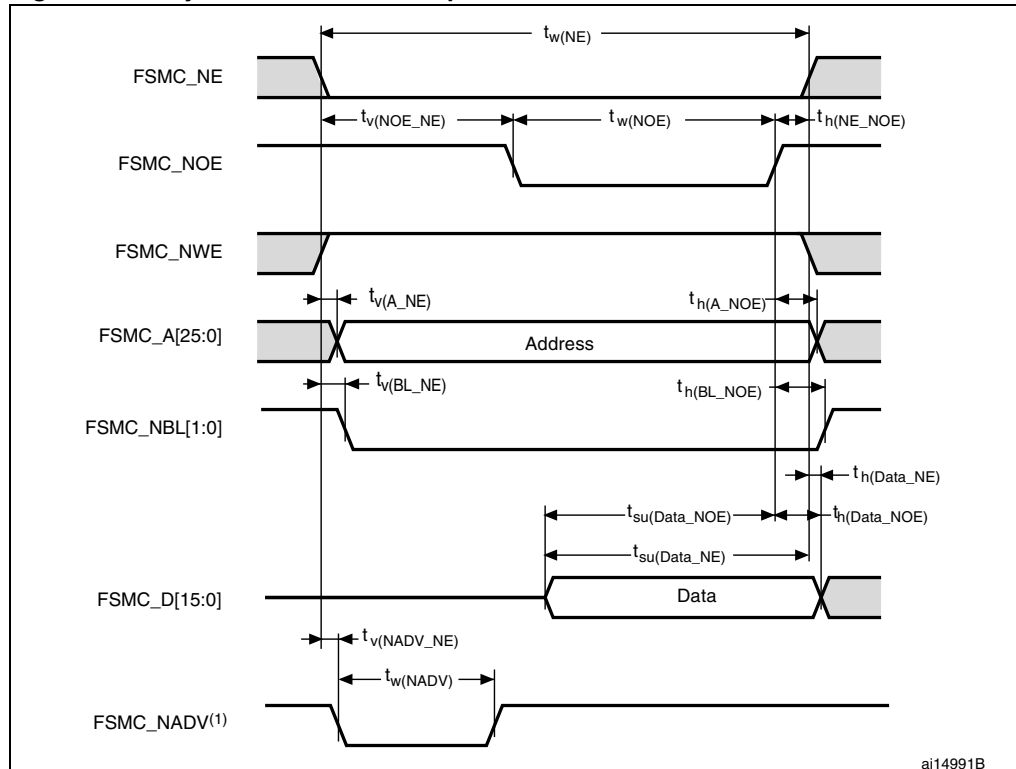

5.3.10 FSMC characteristics

Asynchronous waveforms and timings

[Figure 24](#) through [Figure 27](#) represent asynchronous waveforms and [Table 31](#) through [Table 34](#) provide the corresponding timings. The results shown in these tables are obtained with the following FSMC configuration:

- AddressSetupTime = 0
- AddressHoldTime = 1
- DataSetupTime = 1

Figure 24. Asynchronous non-multiplexed SRAM/PSRAM/NOR read waveforms

1. Mode 2/B, C and D only. In Mode 1, FSMC_NADV is not used.

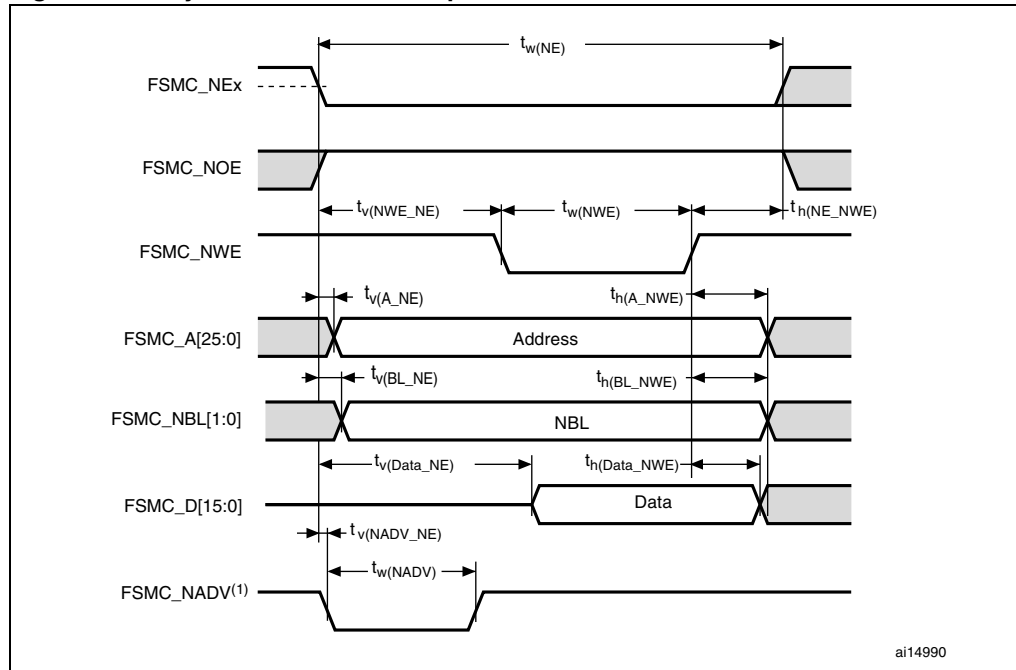

Table 31. Asynchronous non-multiplexed SRAM/PSRAM/NOR read timings^{(1) (2)}

| Symbol | Parameter | Min | Max | Unit |
|---------------------|---|-------------------|-------------------|------|
| $t_{w(NE)}$ | FSMC_NE low time | $5T_{HCLK} - 1.5$ | $5T_{HCLK} + 2$ | ns |

Synchronous waveforms and timings

Figure 28 through Figure 31 represent synchronous waveforms and Table 36 through Table 38 provide the corresponding timings. The results shown in these tables are obtained with the following FSMC configuration:

- BurstAccessMode = FSMC_BurstAccessMode_Enable;
- MemoryType = FSMC_MemoryType_CRAM;
- WriteBurst = FSMC_WriteBurst_Enable;
- CLKDivision = 1; (0 is not supported, see the STM32F10xxx reference manual)
- DataLatency = 1 for NOR Flash; DataLatency = 0 for PSRAM

Figure 28. Synchronous multiplexed NOR/PSRAM read timings

1. $C_L = 15 \text{ pF}$.
2. Based on characterization, not tested in production.
3. Guaranteed by design, not tested in production.

5.3.11 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- **FTB: A Burst of Fast Transient voltage** (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in [Table 41](#). They are based on the EMS levels and classes defined in application note AN1709.

Table 41. EMS characteristics

| Symbol | Parameter | Conditions | Level/Class |
|------------|---|---|-------------|
| V_{FESD} | Voltage limits to be applied on any I/O pin to induce a functional disturbance | $V_{DD} = 3.3\text{ V}$, LQFP144, $T_A = +25\text{ °C}$, $f_{HCLK} = 72\text{ MHz}$ conforms to IEC 61000-4-2 | 2B |
| V_{EFTB} | Fast transient voltage burst limits to be applied through 100 pF on V_{DD} and V_{SS} pins to induce a functional disturbance | $V_{DD} = 3.3\text{ V}$, LQFP144, $T_A = +25\text{ °C}$, $f_{HCLK} = 72\text{ MHz}$ conforms to IEC 61000-4-4 | 4A |

Designing hardened software to avoid noise problems

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It should be noted that good EMC performance is highly dependent on the user application and the software in particular.

Therefore it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

Software recommendations

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical Data corruption (control registers...)

Prequalification trials

Most of the common failures (unexpected reset and program counter corruption) can be reproduced by manually forcing a low state on the NRST pin or the Oscillator pins for 1 second.

To complete these trials, ESD stress can be applied directly on the device, over the range of specification values. When unexpected behavior is detected, the software can be hardened to prevent unrecoverable errors occurring (see application note AN1015).

Electromagnetic Interference (EMI)

The electromagnetic field emitted by the device are monitored while a simple application is executed (toggling 2 LEDs through the I/O ports). This emission test is compliant with IEC 61967-2 standard which specifies the test board and the pin loading.

Table 42. EMI characteristics

| Symbol | Parameter | Conditions | Monitored frequency band | Max vs. [f _{HSE} /f _{HCLK}] | | Unit |
|------------------|------------|---|--------------------------|--|----------|------------|
| | | | | 8/48 MHz | 8/72 MHz | |
| S _{EMI} | Peak level | V _{DD} = 3.3 V, T _A = 25 °C, LQFP144 package compliant with IEC 61967-2 | 0.1 to 30 MHz | 8 | 12 | dB μ V |
| | | | 30 to 130 MHz | 31 | 21 | |
| | | | 130 MHz to 1GHz | 28 | 33 | |
| | | | SAE EMI Level | 4 | 4 | - |

5.3.12 Absolute maximum ratings (electrical sensitivity)

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts \times (n+1) supply pins). This test conforms to the JESD22-A114/C101 standard.

Table 43. ESD absolute maximum ratings

| Symbol | Ratings | Conditions | Class | Maximum value ⁽¹⁾ | Unit |
|-----------------------|---|--|-------|------------------------------|------|
| V _{ESD(HBM)} | Electrostatic discharge voltage (human body model) | T _A = +25 °C, conforming to JESD22-A114 | 2 | 2000 | V |
| V _{ESD(CDM)} | Electrostatic discharge voltage (charge device model) | T _A = +25 °C, conforming to JESD22-C101 | II | 500 | |

1. Based on characterization results, not tested in production.

Static latch-up

Two complementary static tests are required on six parts to assess the latch-up performance:

- A supply overvoltage is applied to each power supply pin
- A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with EIA/JESD 78A IC latch-up standard.

Table 44. Electrical sensitivities

| Symbol | Parameter | Conditions | Class |
|--------|-----------------------|--|------------|
| LU | Static latch-up class | $T_A = +105\text{ °C}$ conforming to JESD78A | II level A |

5.3.13 I/O port characteristics

General input/output characteristics

Unless otherwise specified, the parameters given in [Table 45](#) are derived from tests performed under the conditions summarized in [Table 10](#). All I/Os are CMOS and TTL compliant.

Table 45. I/O static characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|-----------|---|---|-----------------------------|------|---------------|-----------|
| V_{IL} | Input low level voltage | TTL ports | -0.5 | | 0.8 | V |
| V_{IH} | Standard IO input high level voltage | | 2 | | $V_{DD}+0.5$ | |
| | IO FT ⁽¹⁾ input high level voltage | 2 | | 5.5V | | |
| V_{IL} | Input low level voltage | CMOS ports | -0.5 | | $0.35 V_{DD}$ | V |
| V_{IH} | Input high level voltage | | $0.65 V_{DD}$ | | $V_{DD}+0.5$ | |
| V_{hys} | Standard IO Schmitt trigger voltage hysteresis ⁽²⁾ | | 200 | | | mV |
| | IO FT Schmitt trigger voltage hysteresis ⁽²⁾ | | $5\% V_{DD}$ ⁽³⁾ | | | mV |
| I_{lkg} | Input leakage current ⁽⁴⁾ | $V_{SS} \leq V_{IN} \leq V_{DD}$ Standard I/Os | | | ± 1 | μA |
| | | $V_{IN} = 5\text{ V}$, I/O FT | | | 3 | |
| R_{PU} | Weak pull-up equivalent resistor ⁽⁵⁾ | $V_{IN} = V_{SS}$ | 30 | 40 | 50 | $k\Omega$ |
| R_{PD} | Weak pull-down equivalent resistor ⁽⁵⁾ | $V_{IN} = V_{DD}$ | 30 | 40 | 50 | $k\Omega$ |
| C_{IO} | I/O pin capacitance | | | 5 | | pF |

1. FT = Five-volt tolerant.
2. Hysteresis voltage between Schmitt trigger switching levels. Based on characterization, not tested in production.
3. With a minimum of 100 mV.
4. Leakage could be higher than max. if negative current is injected on adjacent pins.
5. Pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This MOS/NMOS contribution to the series resistance is minimum (~10% order).

All I/Os are CMOS and TTL compliant (no software configuration required), their characteristics consider the most strict CMOS-technology or TTL parameters:

- For V_{IH} :
 - if V_{DD} is in the [2.00 V - 3.08 V] range: CMOS characteristics but TTL included
 - if V_{DD} is in the [3.08 V - 3.60 V] range: TTL characteristics but CMOS included
- For V_{IL} :
 - if V_{DD} is in the [2.00 V - 2.28 V] range: TTL characteristics but CMOS included
 - if V_{DD} is in the [2.28 V - 3.60 V] range: CMOS characteristics but TTL included

Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to +/-8 mA, and sink +20 mA (with a relaxed V_{OL}).

In the user application, the number of I/O pins which can drive current must be limited to respect the absolute maximum rating specified in [Section 5.2](#):

- The sum of the currents sourced by all the I/Os on V_{DD} , plus the maximum Run consumption of the MCU sourced on V_{DD} , cannot exceed the absolute maximum rating I_{VDD} (see [Table 8](#)).
- The sum of the currents sunk by all the I/Os on V_{SS} plus the maximum Run consumption of the MCU sunk on V_{SS} cannot exceed the absolute maximum rating I_{VSS} (see [Table 8](#)).

Output voltage levels

Unless otherwise specified, the parameters given in [Table 46](#) are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in [Table 10](#). All I/Os are CMOS and TTL compliant.

Table 46. Output voltage characteristics

| Symbol | Parameter | Conditions | Min | Max | Unit |
|-------------------|---|---|--------------|-----|------|
| $V_{OL}^{(1)}$ | Output low level voltage for an I/O pin when 8 pins are sunk at same time | TTL port $I_{IO} = +8 \text{ mA}$ $2.7 \text{ V} < V_{DD} < 3.6 \text{ V}$ | | 0.4 | V |
| $V_{OH}^{(2)}$ | Output high level voltage for an I/O pin when 8 pins are sourced at same time | | $V_{DD}-0.4$ | | |
| $V_{OL}^{(1)}$ | Output low level voltage for an I/O pin when 8 pins are sunk at same time | CMOS port $I_{IO} = +8 \text{ mA}$ $2.7 \text{ V} < V_{DD} < 3.6 \text{ V}$ | | 0.4 | V |
| $V_{OH}^{(2)}$ | Output high level voltage for an I/O pin when 8 pins are sourced at same time | | 2.4 | | |
| $V_{OL}^{(1)(3)}$ | Output low level voltage for an I/O pin when 8 pins are sunk at same time | $I_{IO} = +20 \text{ mA}$ $2.7 \text{ V} < V_{DD} < 3.6 \text{ V}$ | | 1.3 | V |
| $V_{OH}^{(2)(3)}$ | Output high level voltage for an I/O pin when 8 pins are sourced at same time | | $V_{DD}-1.3$ | | |
| $V_{OL}^{(1)(3)}$ | Output low level voltage for an I/O pin when 8 pins are sunk at same time | $I_{IO} = +6 \text{ mA}$ $2 \text{ V} < V_{DD} < 2.7 \text{ V}$ | | 0.4 | V |
| $V_{OH}^{(2)(3)}$ | Output high level voltage for an I/O pin when 8 pins are sourced at same time | | $V_{DD}-0.4$ | | |

1. The I_{IO} current sunk by the device must always respect the absolute maximum rating specified in [Table 8](#) and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VSS} .
2. The I_{IO} current sourced by the device must always respect the absolute maximum rating specified in [Table 8](#) and the sum of I_{IO} (I/O ports and control pins) must not exceed I_{VDD} .
3. Based on characterization data, not tested in production.

Input/output AC characteristics

The definition and values of input/output AC characteristics are given in [Figure 42](#) and [Table 47](#), respectively.

Unless otherwise specified, the parameters given in [Table 47](#) are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in [Table 10](#).

Table 47. I/O AC characteristics⁽¹⁾

| MODEx[1:0] bit value ⁽¹⁾ | Symbol | Parameter | Conditions | Min | Max | Unit |
|-------------------------------------|---------------------------------|---|--|-----|--------------------|------|
| 10 | $f_{\max(\text{IO})\text{out}}$ | Maximum frequency ⁽²⁾ | $C_L = 50 \text{ pF}$, $V_{DD} = 2 \text{ V to } 3.6 \text{ V}$ | | 2 | MHz |
| | $t_{f(\text{IO})\text{out}}$ | Output high to low level fall time | $C_L = 50 \text{ pF}$, $V_{DD} = 2 \text{ V to } 3.6 \text{ V}$ | | 125 ⁽³⁾ | ns |
| | $t_{r(\text{IO})\text{out}}$ | Output low to high level rise time | | | 125 ⁽³⁾ | |
| 01 | $f_{\max(\text{IO})\text{out}}$ | Maximum frequency ⁽²⁾ | $C_L = 50 \text{ pF}$, $V_{DD} = 2 \text{ V to } 3.6 \text{ V}$ | | 10 | MHz |
| | $t_{f(\text{IO})\text{out}}$ | Output high to low level fall time | $C_L = 50 \text{ pF}$, $V_{DD} = 2 \text{ V to } 3.6 \text{ V}$ | | 25 ⁽³⁾ | ns |
| | $t_{r(\text{IO})\text{out}}$ | Output low to high level rise time | | | 25 ⁽³⁾ | |
| 11 | $F_{\max(\text{IO})\text{out}}$ | Maximum frequency ⁽²⁾ | $C_L = 30 \text{ pF}$, $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$ | | 50 | MHz |
| | | | $C_L = 50 \text{ pF}$, $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$ | | 30 | MHz |
| | | | $C_L = 50 \text{ pF}$, $V_{DD} = 2 \text{ V to } 2.7 \text{ V}$ | | 20 | MHz |
| | $t_{f(\text{IO})\text{out}}$ | Output high to low level fall time | $C_L = 30 \text{ pF}$, $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$ | | 5 ⁽³⁾ | ns |
| | | | $C_L = 50 \text{ pF}$, $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$ | | 8 ⁽³⁾ | |
| | | | $C_L = 50 \text{ pF}$, $V_{DD} = 2 \text{ V to } 2.7 \text{ V}$ | | 12 ⁽³⁾ | |
| | $t_{r(\text{IO})\text{out}}$ | Output low to high level rise time | $C_L = 30 \text{ pF}$, $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$ | | 5 ⁽³⁾ | |
| | | | $C_L = 50 \text{ pF}$, $V_{DD} = 2.7 \text{ V to } 3.6 \text{ V}$ | | 8 ⁽³⁾ | |
| | | | $C_L = 50 \text{ pF}$, $V_{DD} = 2 \text{ V to } 2.7 \text{ V}$ | | 12 ⁽³⁾ | |
| - | $t_{\text{EXTI}pw}$ | Pulse width of external signals detected by the EXTI controller | | 10 | | ns |

1. The I/O speed is configured using the MODEx[1:0] bits. Refer to the STM32F10xxx reference manual for a description of GPIO Port configuration register.
2. The maximum frequency is defined in [Figure 42](#).
3. Guaranteed by design, not tested in production.

Figure 42. I/O AC characteristics definition

5.3.14 NRST pin characteristics

The NRST pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor, R_{PU} (see [Table 45](#)).

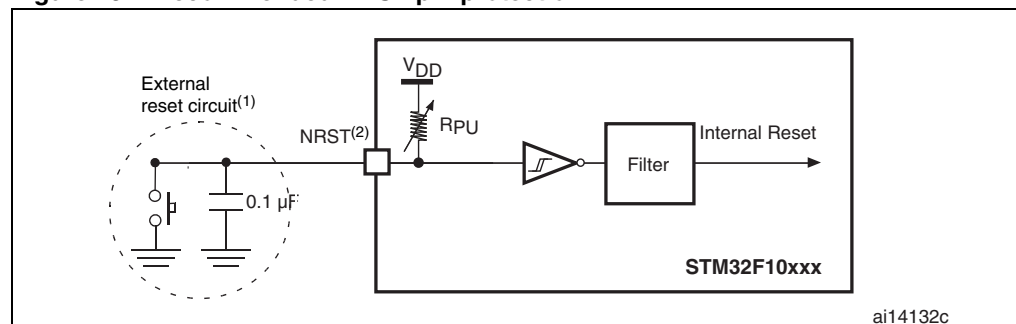

Unless otherwise specified, the parameters given in [Table 48](#) are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in [Table 10](#).

Table 48. NRST pin characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|----------------------|---|-------------------|------|-----|--------------|------------|
| $V_{IL(NRST)}^{(1)}$ | NRST Input low level voltage | | -0.5 | | 0.8 | V |
| $V_{IH(NRST)}^{(1)}$ | NRST Input high level voltage | | 2 | | $V_{DD}+0.5$ | |
| $V_{hys(NRST)}$ | NRST Schmitt trigger voltage hysteresis | | | 200 | | mV |
| R_{PU} | Weak pull-up equivalent resistor ⁽²⁾ | $V_{IN} = V_{SS}$ | 30 | 40 | 50 | k Ω |
| $V_{F(NRST)}^{(1)}$ | NRST Input filtered pulse | | | | 100 | ns |
| $V_{NF(NRST)}^{(1)}$ | NRST Input not filtered pulse | | 300 | | | ns |

1. Guaranteed by design, not tested in production.
2. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance must be minimum (~10% order).

Figure 43. Recommended NRST pin protection

2. The reset network protects the device against parasitic resets.
3. The user must ensure that the level on the NRST pin can go below the $V_{IL(NRST)}$ max level specified in [Table 48](#). Otherwise the reset will not be taken into account by the device.

5.3.15 TIM timer characteristics

The parameters given in [Table 49](#) are guaranteed by design.

Refer to [Section 5.3.13: I/O port characteristics](#) for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

Table 49. TIMx⁽¹⁾ characteristics

| Symbol | Parameter | Conditions | Min | Max | Unit |
|------------------|---|--------------------------------|--------|----------------------|---------------|
| $t_{res(TIM)}$ | Timer resolution time | | 1 | | $t_{TIMxCLK}$ |
| | | $f_{TIMxCLK} = 72 \text{ MHz}$ | 13.9 | | ns |
| f_{EXT} | Timer external clock frequency on CH1 to CH4 | | 0 | $f_{TIMxCLK}/2$ | MHz |
| | | $f_{TIMxCLK} = 72 \text{ MHz}$ | 0 | 36 | MHz |
| Res_{TIM} | Timer resolution | | | 16 | bit |
| $t_{COUNTER}$ | 16-bit counter clock period when internal clock is selected | | 1 | 65536 | $t_{TIMxCLK}$ |
| | | $f_{TIMxCLK} = 72 \text{ MHz}$ | 0.0139 | 910 | μs |
| t_{MAX_COUNT} | Maximum possible count | | | 65536×65536 | $t_{TIMxCLK}$ |
| | | $f_{TIMxCLK} = 72 \text{ MHz}$ | | 59.6 | s |

1. TIMx is used as a general term to refer to the TIM1, TIM2, TIM3 and TIM4 timers.

5.3.16 Communications interfaces

I²C interface characteristics

Unless otherwise specified, the parameters given in [Table 50](#) are derived from tests performed under ambient temperature, f_{PCLK1} frequency and V_{DD} supply voltage conditions summarized in [Table 10](#).

The STM32F103xC, STM32F103xD and STM32F103xE performance line I²C interface meets the requirements of the standard I²C communication protocol with the following restrictions: the I/O pins SDA and SCL are mapped to are not “true” open-drain. When configured as open-drain, the PMOS connected between the I/O pin and V_{DD} is disabled, but is still present.

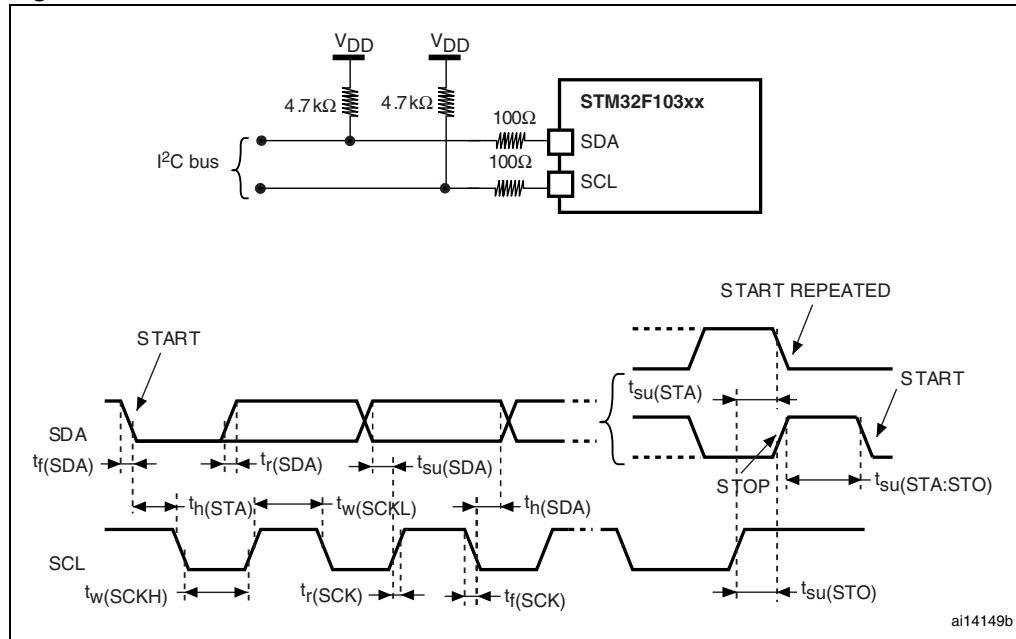

The I²C characteristics are described in [Table 50](#). Refer also to [Section 5.3.13: I/O port characteristics](#) for more details on the input/output alternate function characteristics (SDA and SCL).

Table 50. I²C characteristics

| Symbol | Parameter | Standard mode I ² C ⁽¹⁾ | | Fast mode I ² C ⁽¹⁾⁽²⁾ | | Unit |
|------------------------------|---|---|------|--|--------------------|---------|
| | | Min | Max | Min | Max | |
| $t_{w(SCLL)}$ | SCL clock low time | 4.7 | | 1.3 | | μ s |
| $t_{w(SCLH)}$ | SCL clock high time | 4.0 | | 0.6 | | |
| $t_{su(SDA)}$ | SDA setup time | 250 | | 100 | | ns |
| $t_{h(SDA)}$ | SDA data hold time | 0 ⁽³⁾ | | 0 ⁽⁴⁾ | 900 ⁽³⁾ | |
| $t_{r(SDA)}$ $t_{r(SCL)}$ | SDA and SCL rise time | | 1000 | $20 + 0.1C_b$ | 300 | |
| $t_{f(SDA)}$ $t_{f(SCL)}$ | SDA and SCL fall time | | 300 | | 300 | |
| $t_{h(STA)}$ | Start condition hold time | 4.0 | | 0.6 | | μ s |
| $t_{su(STA)}$ | Repeated Start condition setup time | 4.7 | | 0.6 | | |
| $t_{su(STO)}$ | Stop condition setup time | 4.0 | | 0.6 | | μ s |
| $t_{w(STO:STA)}$ | Stop to Start condition time (bus free) | 4.7 | | 1.3 | | μ s |
| C_b | Capacitive load for each bus line | | 400 | | 400 | pF |

1. Guaranteed by design, not tested in production.
2. f_{PCLK1} must be higher than 2 MHz to achieve the maximum standard mode I²C frequency. It must be higher than 4 MHz to achieve the maximum fast mode I²C frequency.
3. The maximum hold time of the Start condition has only to be met if the interface does not stretch the low period of SCL signal.
4. The device must internally provide a hold time of at least 300ns for the SDA signal in order to bridge the undefined region of the falling edge of SCL.

Figure 44. I²C bus AC waveforms and measurement circuit

1. Measurement points are done at CMOS levels: 0.3V_{DD} and 0.7V_{DD}.

Table 51. SCL frequency (f_{PCLK1} = 36 MHz, V_{DD} = 3.3 V)⁽¹⁾⁽²⁾

| f _{SCL} (kHz) | I2C_CCR value |
|------------------------|-------------------------|
| | R _P = 4.7 kΩ |
| 400 | 0x801E |
| 300 | 0x8028 |
| 200 | 0x803C |
| 100 | 0x00B4 |
| 50 | 0x0168 |
| 20 | 0x0384 |

1. R_P = External pull-up resistance, f_{SCL} = I²C speed.
2. For speeds around 200 kHz, the tolerance on the achieved speed is of ±5%. For other speed ranges, the tolerance on the achieved speed is ±2%. These variations depend on the accuracy of the external components used to design the application.

I²S - SPI characteristics

Unless otherwise specified, the parameters given in [Table 52](#) for SPI or in [Table 53](#) for I²S are derived from tests performed under ambient temperature, f_{PCLKx} frequency and V_{DD} supply voltage conditions summarized in [Table 10](#).

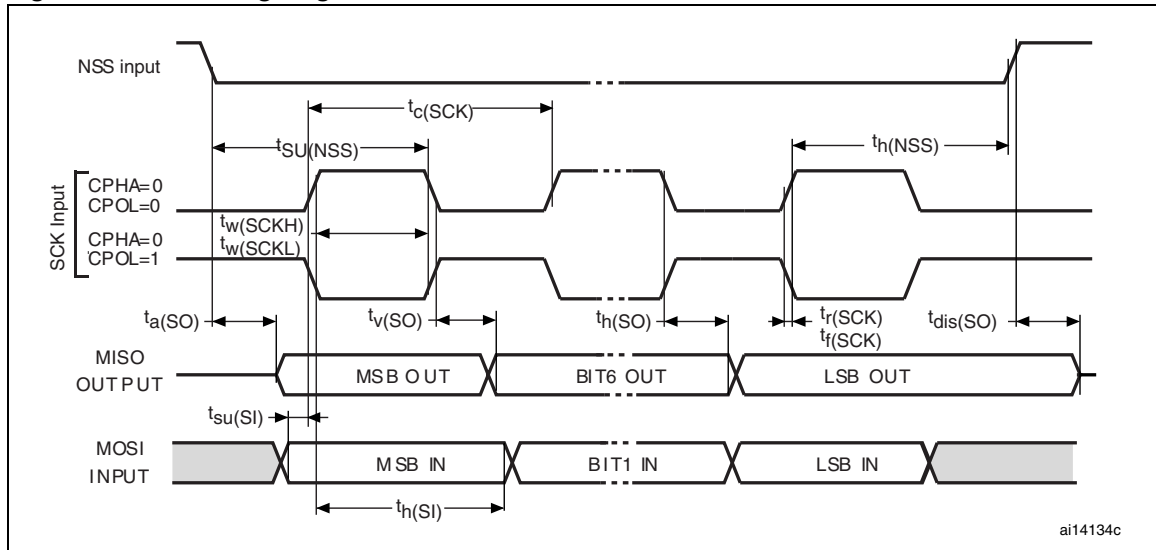

Refer to [Section 5.3.13: I/O port characteristics](#) for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI and WS, CK, SD for I²S).

Table 52. SPI characteristics⁽¹⁾

| Symbol | Parameter | Conditions | Min | Max | Unit |
|--|----------------------------------|---|-------------|-------------|------|
| f_{SCK} $1/t_{c(SCK)}$ | SPI clock frequency | Master mode | | 18 | MHz |
| | | Slave mode | | 18 | |
| $t_{r(SCK)}$ $t_{f(SCK)}$ | SPI clock rise and fall time | Capacitive load: C = 30 pF | | 8 | ns |
| DuCy(SCK) | SPI slave input clock duty cycle | Slave mode | 30 | 70 | % |
| $t_{su(NSS)}^{(2)}$ | NSS setup time | Slave mode | $4t_{PCLK}$ | | ns |
| $t_{h(NSS)}^{(2)}$ | NSS hold time | Slave mode | $2t_{PCLK}$ | | |
| $t_{w(SCKH)}^{(2)}$ $t_{w(SCKL)}^{(2)}$ | SCK high and low time | Master mode, $f_{PCLK} = 36$ MHz, presc = 4 | 50 | 60 | |
| $t_{su(MI)}^{(2)}$ $t_{su(SI)}^{(2)}$ | Data input setup time | Master mode | 5 | | |
| | | Slave mode | 5 | | |
| $t_{h(MI)}^{(2)}$ $t_{h(SI)}^{(2)}$ | Data input hold time | Master mode | 5 | | |
| | | Slave mode | 4 | | |
| $t_{a(SO)}^{(2)(3)}$ | Data output access time | Slave mode, $f_{PCLK} = 20$ MHz | 0 | $3t_{PCLK}$ | |
| $t_{dis(SO)}^{(2)(4)}$ | Data output disable time | Slave mode | 2 | 10 | |
| $t_{v(SO)}^{(2)(1)}$ | Data output valid time | Slave mode (after enable edge) | | 25 | |
| $t_{v(MO)}^{(2)(1)}$ | Data output valid time | Master mode (after enable edge) | | 5 | |
| $t_{h(SO)}^{(2)}$ $t_{h(MO)}^{(2)}$ | Data output hold time | Slave mode (after enable edge) | 15 | | |
| | | Master mode (after enable edge) | 2 | | |

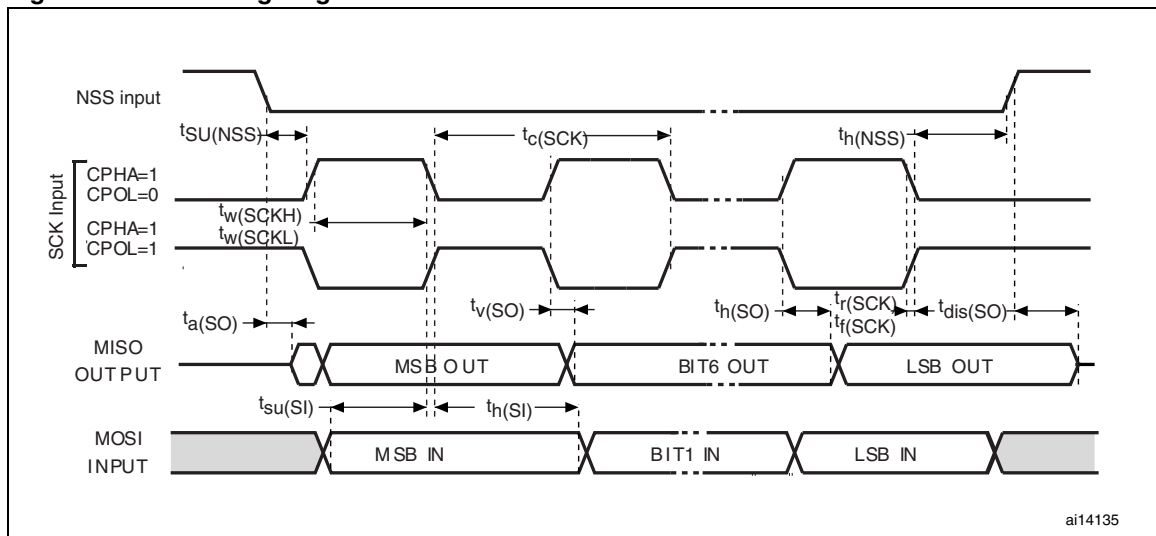

1. Remapped SPI1 characteristics to be determined.
2. Based on characterization, not tested in production.
3. Min time is for the minimum time to drive the output and the max time is for the maximum time to validate the data.
4. Min time is for the minimum time to invalidate the output and the max time is for the maximum time to put the data in Hi-Z

Figure 45. SPI timing diagram - slave mode and CPHA = 0

ai14134c

Figure 46. SPI timing diagram - slave mode and CPHA = 1⁽¹⁾

ai14135

1. Measurement points are done at CMOS levels: 0.3V_{DD} and 0.7V_{DD}.

Figure 47. SPI timing diagram - master mode⁽¹⁾

1. Measurement points are done at CMOS levels: $0.3V_{DD}$ and $0.7V_{DD}$.

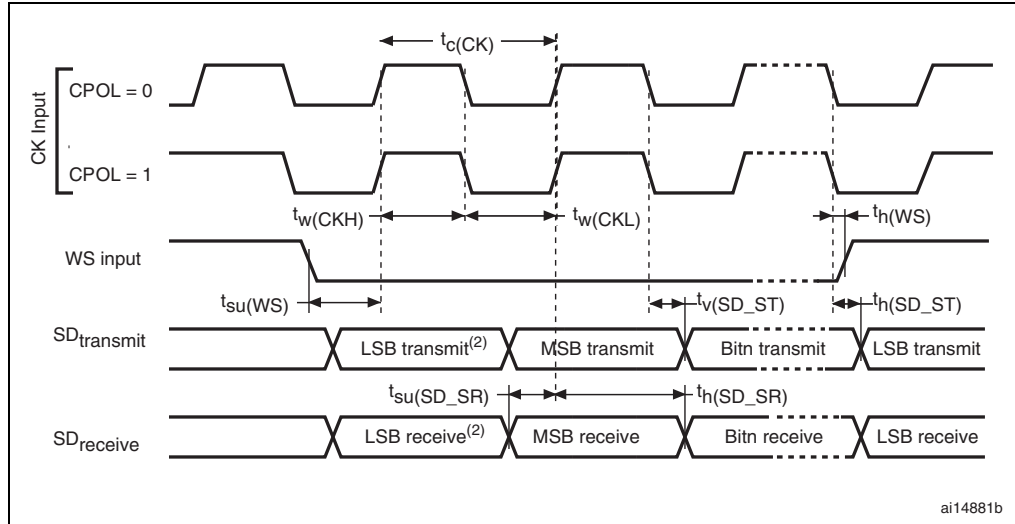

Table 53. I²S characteristics

| Symbol | Parameter | Conditions | Min | Max | Unit |
|----------------------------|---|---|-------|-------|------|
| DuCy(SCK) | I ² S slave input clock duty cycle | Slave mode | 30 | 70 | % |
| f_{CK} $1/t_{c(CK)}$ | I ² S clock frequency | Master mode (data: 16 bits, Audio frequency = 48 kHz) | 1.522 | 1.525 | MHz |
| | | Slave mode | 0 | 6.5 | |
| $t_{r(CK)}$ $t_{f(CK)}$ | I ² S clock rise and fall time | Capacitive load $C_L = 50$ pF | | 8 | ns |
| $t_{v(WS)}^{(1)}$ | WS valid time | Master mode | 3 | | |
| $t_{h(WS)}^{(1)}$ | WS hold time | Master mode | I2S2 | 2 | |
| | | | I2S3 | 0 | |
| $t_{su(WS)}^{(1)}$ | WS setup time | Slave mode | 4 | | |
| $t_{h(WS)}^{(1)}$ | WS hold time | Slave mode | 0 | | |
| $t_{w(CKH)}^{(1)}$ | CK high and low time | Master $f_{PCLK} = 16$ MHz, audio frequency = 48 kHz | 312.5 | | |
| $t_{w(CKL)}^{(1)}$ | | | 345 | | |
| $t_{su(SD_MR)}^{(1)}$ | Data input setup time | Master receiver | I2S2 | 2 | |
| | | | I2S3 | 6.5 | |
| $t_{su(SD_SR)}^{(1)}$ | Data input setup time | Slave receiver | 1.5 | | |
| $t_{h(SD_MR)}^{(1)(2)}$ | Data input hold time | Master receiver | 0 | | |
| $t_{h(SD_SR)}^{(1)(2)}$ | | Slave receiver | 0.5 | | |
| $t_{v(SD_ST)}^{(1)(2)}$ | Data output valid time | Slave transmitter (after enable edge) | | 18 | |
| $t_{h(SD_ST)}^{(1)}$ | Data output hold time | Slave transmitter (after enable edge) | 11 | | |
| $t_{v(SD_MT)}^{(1)(2)}$ | Data output valid time | Master transmitter (after enable edge) | | 3 | |
| $t_{h(SD_MT)}^{(1)}$ | Data output hold time | Master transmitter (after enable edge) | 0 | | |

1. Based on design simulation and/or characterization results, not tested in production.

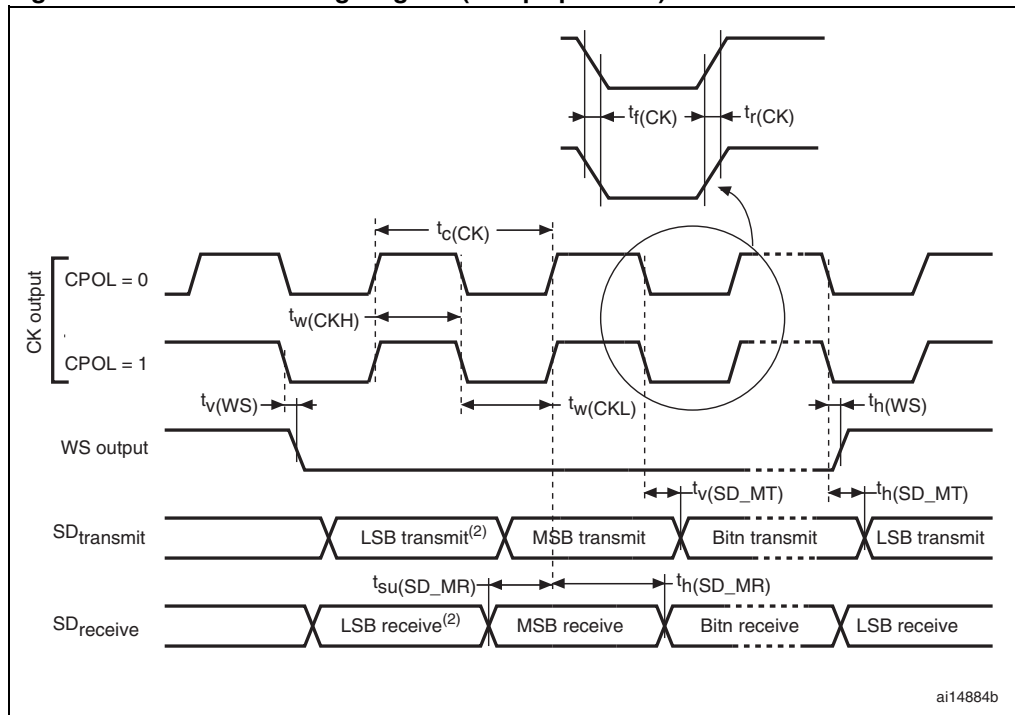

2. Depends on f_{PCLK} . For example, if $f_{PCLK} = 8$ MHz, then $T_{PCLK} = 1/f_{PCLK} = 125$ ns.

Figure 48. I²S slave timing diagram (Philips protocol)⁽¹⁾

1. Measurement points are done at CMOS levels: $0.3 \times V_{DD}$ and $0.7 \times V_{DD}$.
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

Figure 49. I²S master timing diagram (Philips protocol)⁽¹⁾

1. Based on characterization, not tested in production.
2. LSB transmit/receive of the previously transmitted byte. No LSB transmit/receive is sent before the first byte.

SD/SDIO MMC card host interface (SDIO) characteristics

Unless otherwise specified, the parameters given in [Table 54](#) are derived from tests performed under ambient temperature, f_{PCLKx} frequency and V_{DD} supply voltage conditions summarized in [Table 10](#).

Refer to [Section 5.3.13: I/O port characteristics](#) for more details on the input/output alternate function characteristics (D[7:0], CMD, CK).

Figure 50. SDIO high-speed mode

ai14887

Figure 51. SD default mode

ai14888

Table 54. SD / MMC characteristics

| Symbol | Parameter | Conditions | Min | Max | Unit |
|---|--|--------------------------|-----|-----|------|
| f_{PP} | Clock frequency in data transfer mode | $C_L \leq 30 \text{ pF}$ | 0 | 48 | MHz |
| $t_{W(CKL)}$ | Clock low time, $f_{PP} = 16 \text{ MHz}$ | $C_L \leq 30 \text{ pF}$ | 32 | | ns |
| $t_{W(CKH)}$ | Clock high time, $f_{PP} = 16 \text{ MHz}$ | $C_L \leq 30 \text{ pF}$ | 31 | | |
| t_r | Clock rise time | $C_L \leq 30 \text{ pF}$ | | 3.5 | |
| t_f | Clock fall time | $C_L \leq 30 \text{ pF}$ | | 5 | |
| CMD, D inputs (referenced to CK) | | | | | |
| t_{ISU} | Input setup time | $C_L \leq 30 \text{ pF}$ | 2 | | ns |
| t_{IH} | Input hold time | $C_L \leq 30 \text{ pF}$ | 0 | | |
| CMD, D outputs (referenced to CK) in MMC and SD HS mode | | | | | |
| t_{OV} | Output valid time | $C_L \leq 30 \text{ pF}$ | | 6 | ns |
| t_{OH} | Output hold time | $C_L \leq 30 \text{ pF}$ | 0.3 | | |
| CMD, D outputs (referenced to CK) in SD default mode⁽¹⁾ | | | | | |
| t_{OVD} | Output valid default time | $C_L \leq 30 \text{ pF}$ | | 7 | ns |
| t_{OHD} | Output hold default time | $C_L \leq 30 \text{ pF}$ | 0.5 | | |

1. Refer to SDIO_CLKCR, the SDI clock control register to control the CK output.

USB characteristics

The USB interface is USB-IF certified (Full Speed).

Table 55. USB startup time

| Symbol | Parameter | Max | Unit |
|---------------------|------------------------------|-----|---------------|
| $t_{STARTUP}^{(1)}$ | USB transceiver startup time | 1 | μs |

1. Guaranteed by design, not tested in production.

Table 56. USB DC electrical characteristics

| Symbol | Parameter | Conditions | Min. ⁽¹⁾ | Max. ⁽¹⁾ | Unit |
|--------------------------------|--------------------------------------|---|---------------------|---------------------|------|
| Input levels | | | | | |
| V _{DD} | USB operating voltage ⁽²⁾ | | 3.0 ⁽³⁾ | 3.6 | V |
| V _{DI} ⁽⁴⁾ | Differential input sensitivity | I(USBDP, USBDM) | 0.2 | | V |
| V _{CM} ⁽⁴⁾ | Differential common mode range | Includes V _{DI} range | 0.8 | 2.5 | |
| V _{SE} ⁽⁴⁾ | Single ended receiver threshold | | 1.3 | 2.0 | |
| Output levels | | | | | |
| V _{OL} | Static output level low | R _L of 1.5 kΩ to 3.6 V ⁽⁵⁾ | | 0.3 | V |
| V _{OH} | Static output level high | R _L of 15 kΩ to V _{SS} ⁽⁵⁾ | 2.8 | 3.6 | |

1. All the voltages are measured from the local ground potential.
2. To be compliant with the USB 2.0 full-speed electrical specification, the USBDP (D+) pin should be pulled up with a 1.5 kΩ resistor to a 3.0-to-3.6 V voltage range.
3. The STM32F103xx USB functionality is ensured down to 2.7 V but not the full USB electrical characteristics which are degraded in the 2.7-to-3.0 V V_{DD} voltage range.
4. Guaranteed by characterization, not tested in production.
5. R_L is the load connected on the USB drivers

Figure 52. USB timings: definition of data signal rise and fall time

Table 57. USB: full-speed electrical characteristics

| Driver characteristics ⁽¹⁾ | | | | | |
|---------------------------------------|---------------------------------|--------------------------------|-----|-----|------|
| Symbol | Parameter | Conditions | Min | Max | Unit |
| t _r | Rise time ⁽²⁾ | C _L = 50 pF | 4 | 20 | ns |
| t _f | Fall Time ⁽²⁾ | C _L = 50 pF | 4 | 20 | ns |
| t _{rfm} | Rise/ fall time matching | t _r /t _f | 90 | 110 | % |
| V _{CRS} | Output signal crossover voltage | | 1.3 | 2.0 | V |

1. Guaranteed by design, not tested in production.
2. Measured from 10% to 90% of the data signal. For more detailed informations, please refer to USB Specification - Chapter 7 (version 2.0).

5.3.17 CAN (controller area network) interface

Refer to [Section 5.3.13: I/O port characteristics](#) for more details on the input/output alternate function characteristics (CAN_TX and CAN_RX).

5.3.18 12-bit ADC characteristics

Unless otherwise specified, the parameters given in [Table 58](#) are derived from tests performed under ambient temperature, f_{PCLK2} frequency and V_{DDA} supply voltage conditions summarized in [Table 10](#).

Note: It is recommended to perform a calibration after each power-up.

Table 58. ADC characteristics

| Symbol | Parameter | Conditions | Min | Typ | Max | Unit |
|------------------|---|---|--|--------------------|--------------------|-------------|
| V_{DDA} | Power supply | | 2.4 | | 3.6 | V |
| V_{REF+} | Positive reference voltage | | 2.4 | | V_{DDA} | V |
| I_{VREF} | Current on the V_{REF} input pin | | | 160 ⁽¹⁾ | 220 ⁽¹⁾ | μ A |
| f_{ADC} | ADC clock frequency | | 0.6 | | 14 | MHz |
| $f_S^{(2)}$ | Sampling rate | | 0.05 | | 1 | MHz |
| $f_{TRIG}^{(2)}$ | External trigger frequency | $f_{ADC} = 14$ MHz | | | 823 | kHz |
| | | | | | 17 | $1/f_{ADC}$ |
| V_{AIN} | Conversion voltage range ⁽³⁾ | | 0 (V_{SSA} or V_{REF-} tied to ground) | | V_{REF+} | V |
| $R_{AIN}^{(2)}$ | External input impedance | See Equation 1 and Table 59 for details | | | 50 | $k\Omega$ |
| $R_{ADC}^{(2)}$ | Sampling switch resistance | | | | 1 | $k\Omega$ |
| $C_{ADC}^{(2)}$ | Internal sample and hold capacitor | | | | 8 | pF |
| $t_{CAL}^{(2)}$ | Calibration time | $f_{ADC} = 14$ MHz | 5.9 | | | μ s |
| | | | 83 | | | $1/f_{ADC}$ |
| $t_{lat}^{(2)}$ | Injection trigger conversion latency | $f_{ADC} = 14$ MHz | | | 0.214 | μ s |
| | | | | | 3 ⁽⁴⁾ | $1/f_{ADC}$ |
| $t_{latr}^{(2)}$ | Regular trigger conversion latency | $f_{ADC} = 14$ MHz | | | 0.143 | μ s |
| | | | | | 2 ⁽⁴⁾ | $1/f_{ADC}$ |
| $t_S^{(2)}$ | Sampling time | $f_{ADC} = 14$ MHz | 0.107 | | 17.1 | μ s |
| | | | 1.5 | | 239.5 | $1/f_{ADC}$ |
| $t_{STAB}^{(2)}$ | Power-up time | | 0 | 0 | 1 | μ s |
| $t_{CONV}^{(2)}$ | Total conversion time (including sampling time) | $f_{ADC} = 14$ MHz | 1 | | 18 | μ s |
| | | | 14 to 252 (t_S for sampling +12.5 for successive approximation) | | | $1/f_{ADC}$ |

1. Based on characterization results, not tested in production.
2. Guaranteed by design, not tested in production.
3. V_{REF+} can be internally connected to V_{DDA} and V_{REF-} can be internally connected to V_{SSA} , depending on the package. Refer to [Section 3: Pinouts and pin descriptions](#) for further details.
4. For external triggers, a delay of $1/f_{PCLK2}$ must be added to the latency specified in [Table 58](#).

Equation 1: R_{AIN} max formula

$$R_{AIN} < \frac{T_S}{f_{ADC} \times C_{ADC} \times \ln(2^{N+2})} - R_{ADC}$$

The formula above ([Equation 1](#)) is used to determine the maximum external impedance allowed for an error below 1/4 of LSB. Here N = 12 (from 12-bit resolution).

Table 59. R_{AIN} max for f_{ADC} = 14 MHz⁽¹⁾

| T _S (cycles) | t _S (μs) | R _{AIN} max (kΩ) |
|-------------------------|---------------------|---------------------------|
| 1.5 | 0.11 | 0.4 |
| 7.5 | 0.54 | 5.9 |
| 13.5 | 0.96 | 11.4 |

1. Guaranteed by design, not tested in production.

Table 60. ADC accuracy - limited test conditions⁽¹⁾⁽²⁾

| Symbol | Parameter | Test conditions | Typ | Max ⁽³⁾ | Unit |
|--------|------------------------------|---|------|--------------------|------|
| ET | Total unadjusted error | f _{PCLK2} = 56 MHz, f _{ADC} = 14 MHz, R _{AIN} < 10 kΩ, V _{DDA} = 3 V to 3.6 V T _A = 25 °C Measurements made after ADC calibration V _{REF+} = V _{DDA} | ±1.3 | ±2 | LSB |
| EO | Offset error | | ±1 | ±1.5 | |
| EG | Gain error | | ±0.5 | ±1.5 | |
| ED | Differential linearity error | | ±0.7 | ±1 | |
| EL | Integral linearity error | | ±0.8 | ±1.5 | |

- ADC DC accuracy values are measured after internal calibration.
- ADC Accuracy vs. Negative Injection Current: Injecting negative current on any of the standard (non-robust) analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current. Any positive injection current within the limits specified for I_{INJ(PIN)} and ΣI_{INJ(PIN)} in [Section 5.3.13](#) does not affect the ADC accuracy.
- Based on characterization, not tested in production.

Table 61. ADC accuracy^{(1) (2)(3)}

| Symbol | Parameter | Test conditions | Typ | Max ⁽⁴⁾ | Unit |
|--------|------------------------------|--|-----------|--------------------|------|
| ET | Total unadjusted error | $f_{PCLK2} = 56 \text{ MHz}$, $f_{ADC} = 14 \text{ MHz}$, $R_{AIN} < 10 \text{ k}\Omega$, $V_{DDA} = 2.4 \text{ V to } 3.6 \text{ V}$ Measurements made after ADC calibration | ± 2 | ± 5 | LSB |
| EO | Offset error | | ± 1.5 | ± 2.5 | |
| EG | Gain error | | ± 1.5 | ± 3 | |
| ED | Differential linearity error | | ± 1 | ± 2 | |
| EL | Integral linearity error | | ± 1.5 | ± 3 | |

1. ADC DC accuracy values are measured after internal calibration.
2. Better performance could be achieved in restricted V_{DD} , frequency, V_{REF} and temperature ranges.
3. ADC Accuracy vs. Negative Injection Current: Injecting negative current on any of the standard (non-robust) analog input pins should be avoided as this significantly reduces the accuracy of the conversion being performed on another analog input. It is recommended to add a Schottky diode (pin to ground) to standard analog pins which may potentially inject negative current. Any positive injection current within the limits specified for $I_{INJ(PIN)}$ and $\Sigma I_{INJ(PIN)}$ in [Section 5.3.13](#) does not affect the ADC accuracy.
4. Based on characterization, not tested in production.

Figure 53. ADC accuracy characteristics

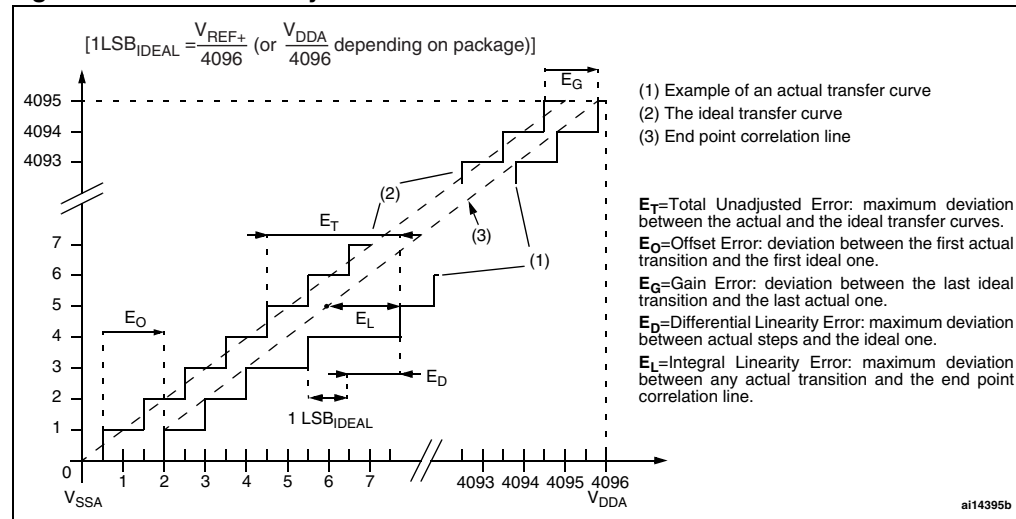

Figure 54. Typical connection diagram using the ADC

1. Refer to [Table 58](#) for the values of R_{AIN} , R_{ADC} and C_{ADC} .
2. $C_{parasitic}$ represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (roughly 7 pF). A high $C_{parasitic}$ value will downgrade conversion accuracy. To remedy this, f_{ADC} should be reduced.

General PCB design guidelines

Power supply decoupling should be performed as shown in [Figure 55](#) or [Figure 56](#), depending on whether V_{REF+} is connected to V_{DDA} or not. The 10 nF capacitors should be ceramic (good quality). They should be placed them as close as possible to the chip.

Figure 55. Power supply and reference decoupling (V_{REF+} not connected to V_{DDA})

1. V_{REF+} and V_{REF-} inputs are available only on 100-pin packages.

Figure 56. Power supply and reference decoupling (V_{REF+} connected to V_{DDA})

1. V_{REF+} and V_{REF-} inputs are available only on 100-pin packages.

5.3.19 DAC electrical specifications

Table 62. DAC characteristics

| Symbol | Parameter | Min | Typ | Max | Unit | Comments |
|----------------------------|---|-----|-----|-------------------|------------|---|
| V_{DDA} | Analog supply voltage | 2.4 | | 3.6 | V | |
| V_{REF+} | Reference supply voltage | 2.4 | | 3.6 | V | V_{REF+} must always be below V_{DDA} |
| V_{SSA} | Ground | 0 | | 0 | V | |
| $R_{LOAD}^{(1)}$ | Resistive load with buffer ON | 5 | | | k Ω | |
| $R_O^{(1)}$ | Impedance output with buffer OFF | | | 15 | k Ω | When the buffer is OFF, the Minimum resistive load between DAC_OUT and V_{SS} to have a 1% accuracy is 1.5 M Ω |
| $C_{LOAD}^{(1)}$ | Capacitive load | | | 50 | pF | Maximum capacitive load at DAC_OUT pin (when the buffer is ON). |
| DAC_OUT min ⁽¹⁾ | Lower DAC_OUT voltage with buffer ON | 0.2 | | | V | It gives the maximum output excursion of the DAC. It corresponds to 12-bit input code (0x0E0) to (0xF1C) at $V_{REF+} = 3.6$ V and (0x155) and (0xEAB) at $V_{REF+} = 2.4$ V |
| DAC_OUT max ⁽¹⁾ | Higher DAC_OUT voltage with buffer ON | | | $V_{DDA} - 0.2$ | V | |
| DAC_OUT min ⁽¹⁾ | Lower DAC_OUT voltage with buffer OFF | | 0.5 | | mV | It gives the maximum output excursion of the DAC. |
| DAC_OUT max ⁽¹⁾ | Higher DAC_OUT voltage with buffer OFF | | | $V_{REF+} - 1LSB$ | V | |
| $I_{DDVREF+}$ | DAC DC current consumption in quiescent mode (Standby mode) | | | 220 | μ A | With no load, worst code (0xF1C) at $V_{REF+} = 3.6$ V in terms of DC consumption on the inputs |
| I_{DDA} | DAC DC current consumption in quiescent mode (Standby mode) | | | 380 | μ A | With no load, middle code (0x800) on the inputs |
| | | | | 480 | μ A | With no load, worst code (0xF1C) at $V_{REF+} = 3.6$ V in terms of DC consumption on the inputs |
| DNL ⁽²⁾ | Differential non linearity Difference between two consecutive code-1LSB) | | | ± 0.5 | LSB | Given for the DAC in 10-bit configuration |
| | | | | ± 2 | LSB | Given for the DAC in 12-bit configuration |
| INL ⁽²⁾ | Integral non linearity (difference between measured value at Code i and the value at Code i on a line drawn between Code 0 and last Code 1023) | | | ± 1 | LSB | Given for the DAC in 10-bit configuration |
| | | | | ± 4 | LSB | Given for the DAC in 12-bit configuration |

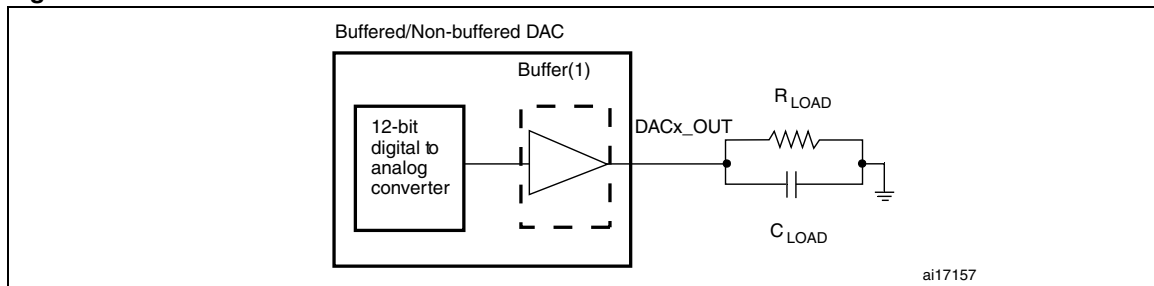

Table 62. DAC characteristics (continued)

| Symbol | Parameter | Min | Typ | Max | Unit | Comments |
|----------------------------|---|-----|-----|-----------|---------------|--|
| Offset ⁽²⁾ | Offset error (difference between measured value at Code (0x800) and the ideal value = $V_{REF+}/2$) | | | ± 10 | mV | Given for the DAC in 12-bit configuration |
| | | | | ± 3 | LSB | Given for the DAC in 10-bit at $V_{REF+} = 3.6\text{ V}$ |
| | | | | ± 12 | LSB | Given for the DAC in 12-bit at $V_{REF+} = 3.6\text{ V}$ |
| Gain error ⁽²⁾ | Gain error | | | ± 0.5 | % | Given for the DAC in 12bit configuration |
| $t_{SETTLING}^{(2)}$ | Settling time (full scale: for a 10-bit input code transition between the lowest and the highest input codes when DAC_OUT reaches final value $\pm 1\text{LSB}$) | | 3 | 4 | μs | $C_{LOAD} \leq 50\text{ pF}$, $R_{LOAD} \geq 5\text{ k}\Omega$ |
| Update rate ⁽²⁾ | Max frequency for a correct DAC_OUT change when small variation in the input code (from code i to i+1LSB) | | | 1 | MS/s | $C_{LOAD} \leq 50\text{ pF}$, $R_{LOAD} \geq 5\text{ k}\Omega$ |
| $t_{WAKEUP}^{(2)}$ | Wakeup time from off state (Setting the ENx bit in the DAC Control register) | | 6.5 | 10 | μs | $C_{LOAD} \leq 50\text{ pF}$, $R_{LOAD} \geq 5\text{ k}\Omega$ input code between lowest and highest possible ones. |
| PSRR+ ⁽¹⁾ | Power supply rejection ratio (to V_{DDA}) (static DC measurement) | | -67 | -40 | dB | No R_{LOAD} , $C_{LOAD} = 50\text{ pF}$ |

1. Guaranteed by design, not tested in production.

2. Guaranteed by characterization, not tested in production.

Figure 57. 12-bit buffered /non-buffered DAC

1. The DAC integrates an output buffer that can be used to reduce the output impedance and to drive external loads directly without the use of an external operational amplifier. The buffer can be bypassed by configuring the BOFFx bit in the DAC_CR register.

5.3.20 Temperature sensor characteristics

Table 63. TS characteristics

| Symbol | Parameter | Min | Typ | Max | Unit |
|--------------------------|--|------|---------|---------|------------------------|
| $T_L^{(1)}$ | V_{SENSE} linearity with temperature | | ± 1 | ± 2 | $^{\circ}\text{C}$ |
| Avg_Slope ⁽¹⁾ | Average slope | 4.0 | 4.3 | 4.6 | mV/ $^{\circ}\text{C}$ |
| $V_{25}^{(1)}$ | Voltage at 25 $^{\circ}\text{C}$ | 1.34 | 1.43 | 1.52 | V |
| $t_{START}^{(2)}$ | Startup time | 4 | | 10 | μs |
| $T_{S_temp}^{(3)(2)}$ | ADC sampling time when reading the temperature | | | 17.1 | μs |

1. Guaranteed by characterization, not tested in production.
2. Guaranteed by design, not tested in production.
3. Shortest sampling time can be determined in the application by multiple iterations.

6 Package characteristics

6.1 Package mechanical data

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK[®] packages, depending on their level of environmental compliance. ECOPACK[®] specifications, grade definitions and product status are available at: www.st.com. ECOPACK[®] is an ST trademark.

6.2 Thermal characteristics

The maximum chip junction temperature (T_{Jmax}) must never exceed the values given in [Table 10: General operating conditions on page 42](#).

The maximum chip-junction temperature, T_{Jmax} , in degrees Celsius, may be calculated using the following equation:

$$T_{Jmax} = T_{Amax} + (P_{Dmax} \times \Theta_{JA})$$

Where:

- T_{Amax} is the maximum ambient temperature in °C,
- Θ_{JA} is the package junction-to-ambient thermal resistance, in °C/W,
- P_{Dmax} is the sum of P_{INTmax} and $P_{I/Omax}$ ($P_{Dmax} = P_{INTmax} + P_{I/Omax}$),
- P_{INTmax} is the product of I_{DD} and V_{DD} , expressed in Watts. This is the maximum chip internal power.

$P_{I/Omax}$ represents the maximum power dissipation on output pins where:

$$P_{I/Omax} = \Sigma (V_{OL} \times I_{OL}) + \Sigma ((V_{DD} - V_{OH}) \times I_{OH}),$$

taking into account the actual V_{OL} / I_{OL} and V_{OH} / I_{OH} of the I/Os at low and high level in the application.

Table 70. Package thermal characteristics

| Symbol | Parameter | Value | Unit |
|---------------|--|-------|------|
| Θ_{JA} | Thermal resistance junction-ambient LFBGA144 - 10 × 10 mm / 0.8 mm pitch | 40 | °C/W |
| | Thermal resistance junction-ambient LQFP144 - 20 × 20 mm / 0.5 mm pitch | 30 | |
| | Thermal resistance junction-ambient LFBGA100 - 10 × 10 mm / 0.8 mm pitch | 40 | |
| | Thermal resistance junction-ambient LQFP100 - 14 × 14 mm / 0.5 mm pitch | 46 | |
| | Thermal resistance junction-ambient LQFP64 - 10 × 10 mm / 0.5 mm pitch | 45 | |
| | Thermal resistance junction-ambient WLCSP64 | 50 | |

6.2.1 Reference document

JESD51-2 Integrated Circuits Thermal Test Method Environment Conditions - Natural Convection (Still Air). Available from www.jedec.org

6.2.2 Selecting the product temperature range

When ordering the microcontroller, the temperature range is specified in the ordering information scheme shown in [Table 71: Ordering information scheme](#).

Each temperature range suffix corresponds to a specific guaranteed ambient temperature at maximum dissipation and, to a specific maximum junction temperature.

As applications do not commonly use the STM32F103xC, STM32F103xD and STM32F103xE at maximum dissipation, it is useful to calculate the exact power consumption and junction temperature to determine which temperature range will be best suited to the application.

The following examples show how to calculate the temperature range needed for a given application.

Example 1: High-performance application

Assuming the following application conditions:

Maximum ambient temperature $T_{Amax} = 82\text{ °C}$ (measured according to JESD51-2),
 $I_{DDmax} = 50\text{ mA}$, $V_{DD} = 3.5\text{ V}$, maximum 20 I/Os used at the same time in output at low level with $I_{OL} = 8\text{ mA}$, $V_{OL} = 0.4\text{ V}$ and maximum 8 I/Os used at the same time in output at low level with $I_{OL} = 20\text{ mA}$, $V_{OL} = 1.3\text{ V}$

$$P_{INTmax} = 50\text{ mA} \times 3.5\text{ V} = 175\text{ mW}$$

$$P_{IOmax} = 20 \times 8\text{ mA} \times 0.4\text{ V} + 8 \times 20\text{ mA} \times 1.3\text{ V} = 272\text{ mW}$$

This gives: $P_{INTmax} = 175\text{ mW}$ and $P_{IOmax} = 272\text{ mW}$:

$$P_{Dmax} = 175 + 272 = 447\text{ mW}$$

Thus: $P_{Dmax} = 447\text{ mW}$

Using the values obtained in [Table 70](#) T_{Jmax} is calculated as follows:

– For LQFP100, 46 °C/W

$$T_{Jmax} = 82\text{ °C} + (46\text{ °C/W} \times 447\text{ mW}) = 82\text{ °C} + 20.6\text{ °C} = 102.6\text{ °C}$$

This is within the range of the suffix 6 version parts ($-40 < T_J < 105\text{ °C}$).

In this case, parts must be ordered at least with the temperature range suffix 6 (see [Table 71: Ordering information scheme](#)).

Example 2: High-temperature application

Using the same rules, it is possible to address applications that run at high ambient temperatures with a low dissipation, as long as junction temperature T_J remains within the specified range.

Assuming the following application conditions:

Maximum ambient temperature $T_{Amax} = 115\text{ °C}$ (measured according to JESD51-2),
 $I_{DDmax} = 20\text{ mA}$, $V_{DD} = 3.5\text{ V}$, maximum 20 I/Os used at the same time in output at low level with $I_{OL} = 8\text{ mA}$, $V_{OL} = 0.4\text{ V}$

$$P_{INTmax} = 20\text{ mA} \times 3.5\text{ V} = 70\text{ mW}$$

$$P_{IOmax} = 20 \times 8\text{ mA} \times 0.4\text{ V} = 64\text{ mW}$$

This gives: $P_{INTmax} = 70\text{ mW}$ and $P_{IOmax} = 64\text{ mW}$:

$$P_{Dmax} = 70 + 64 = 134\text{ mW}$$

Thus: $P_{Dmax} = 134\text{ mW}$

Using the values obtained in [Table 70](#) T_{Jmax} is calculated as follows:

– For LQFP100, 46 °C/W

$$T_{Jmax} = 115\text{ °C} + (46\text{ °C/W} \times 134\text{ mW}) = 115\text{ °C} + 6.2\text{ °C} = 121.2\text{ °C}$$

This is within the range of the suffix 7 version parts ($-40 < T_J < 125\text{ °C}$).

In this case, parts must be ordered at least with the temperature range suffix 7 (see [Table 71: Ordering information scheme](#)).

Figure 69. LQFP100 P_D max vs. T_A

7 Part numbering

Table 71. Ordering information scheme

| Example: | STM32 | F | 103 | R | C | T | 6 | xxx |
|---|-------|---|-----|---|---|---|---|-----|
| Device family STM32 = ARM-based 32-bit microcontroller | | | | | | | | |
| Product type F = general-purpose | | | | | | | | |
| Device subfamily 103 = performance line | | | | | | | | |
| Pin count R = 64 pins V = 100 pins Z = 144 pins | | | | | | | | |
| Flash memory size C = 256 Kbytes of Flash memory D = 384 Kbytes of Flash memory E = 512 Kbytes of Flash memory | | | | | | | | |
| Package H = BGA T = LQFP Y = WLCSP64 | | | | | | | | |
| Temperature range 6 = Industrial temperature range, -40 to 85 °C. 7 = Industrial temperature range, -40 to 105 °C. | | | | | | | | |
| Options xxx = programmed parts TR = tape and real | | | | | | | | |

For a list of available options (speed, package, etc.) or for further information on any aspect of this device, please contact your nearest ST sales office.

8 Revision history

Table 72. Document revision history

| Date | Revision | Changes |
|-------------|----------|---|
| 07-Apr-2008 | 1 | Initial release. |
| 22-May-2008 | 2 | <p>Document status promoted from Target Specification to Preliminary Data.</p> <p><i>Section 1: Introduction</i> and <i>Section 2.2: Full compatibility throughout the family</i> modified. Small text changes.</p> <p><i>Note 2</i> added in <i>Table 2: STM32F103xC, STM32F103xD and STM32F103xE features and peripheral counts on page 11</i>.</p> <p>LQPF100/BGA100 column added to <i>Table 6: FSMC pin definition on page 36</i>.</p> <p>Values and Figures added to <i>Maximum current consumption on page 44</i> (see <i>Table 14, Table 15, Table 16</i> and <i>Table 17</i> and see <i>Figure 14, Figure 15, Figure 17, Figure 18</i> and <i>Figure 19</i>).</p> <p>Values added to <i>Typical current consumption on page 50</i> (see <i>Table 18, Table 19</i> and <i>Table 20</i>). <i>Table 19: Typical current consumption in Standby mode</i> removed.</p> <p><i>Note 4</i> and <i>Note 1</i> added to <i>Table 56: USB DC electrical characteristics</i> and <i>Table 57: USB: full-speed electrical characteristics on page 97</i>, respectively.</p> <p>V_{USB} added to <i>Table 56: USB DC electrical characteristics on page 97</i>.</p> <p><i>Figure 64: Recommended footprint(1) on page 111</i> corrected.</p> <p><i>Equation 1</i> corrected. <i>Figure 69: LQFP100 PD max vs. TA on page 116</i> modified.</p> <p>Tolerance values corrected in <i>Table 64: LFBGA144 – 144-ball low profile fine pitch ball grid array, 10 x 10 mm, 0.8 mm pitch, package data on page 107</i>.</p> |
