

MC68LK332*Technical Supplement***16.78 MHz Electrical Characteristics**

Devices in the 68300 Modular Microcontroller Family are built up from a selection of standard functional modules. The MC68LK332 incorporates a central processing unit (CPU32), a system integration module (SIM), a queued serial module (QSM), a time processor unit (TPU), and a 2 K-byte static RAM module with TPU emulation capability (TPURAM). The functionality of the MC68LK332 is enhanced from the MC68L332 to include an operational PLL.

This publication contains a new electrical characteristics appendix for the MC68LK332 to be used in conjunction with the *MC68332 User's Manual* (MC68332UM/AD).

Table 1 Maximum Ratings

Num	Rating	Symbol	Value	Unit
1	Supply Voltage ^{1, 2, 3}	V_{DD}	- 0.3 to + 6.5	V
2	Input Voltage ^{1, 2, 3, 4, 5, 7}	V_{IN}	- 0.3 to + 6.5	V
3	Instantaneous Maximum Current Single Pin Limit (all pins) ^{1, 3, 5, 6}	I_D	25	mA
4	Operating Maximum Current Digital Input Disruptive Current ^{3, 5, 6, 7, 8} $V_{NEGCLMAP} \cong -0.3\text{ V}$ $V_{POSCLAMP} \cong V_{DD} + 0.3$	I_{id}	- 500 to 500	μA
5	Operating Temperature Range C Suffix	T_A	T_L to T_H - 40 to 85	$^{\circ}\text{C}$
6	Storage Temperature Range	T_{stg}	- 55 to 150	$^{\circ}\text{C}$

NOTES:

1. Permanent damage can occur if maximum ratings are exceeded. Exposure to voltages or currents in excess of recommended values affects device reliability. Device modules may not operate normally while being exposed to electrical extremes.
2. Although sections of the device contain circuitry to protect against damage from high static voltages or electrical fields, take normal precautions to avoid exposure to voltages higher than maximum-rated voltages.
3. This parameter is periodically sampled rather than 100% tested.
4. All pins except TSC.
5. Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.
6. Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current.
7. All functional non-supply pins are internally clamped to V_{SS} . All functional pins except EXTAL and XFC are internally clamped to V_{DD} .
8. Total input current for all digital input-only and all digital input/output pins must not exceed 10 mA. Exceeding this limit can cause disruption of normal operation.

Table 2 MC68LK332 Typical Ratings

Num	Rating	Symbol	Value	Unit
1	Supply Voltage	V_{DD}	3.3	V
2	Operating Temperature	T_A	25	°C
3	V_{DD} Supply Current	I_{DD}	45	mA
	RUN		125	μA
	LPSTOP, VCO off LPSTOP, External clock, max f_{sys}		1.0	mA
4	Clock Synthesizer Operating Voltage	V_{DDSYN}	3.3	V
5	V_{DDSYN} Supply Current	I_{DDSYN}	1.0	mA
	VCO on, maximum f_{sys}		2.0	mA
	External Clock, maximum f_{sys}		100	μA
	LPSTOP, VCO off V_{DD} powered down		50	μA
6	RAM Standby Current	I_{SB}	3.0	μA
	Normal RAM operation Standby operation		10	μA
7	Power Dissipation	P_D	148.0	mW

Table 3 Thermal Characteristics

Num	Rating	Symbol	Value	Unit
1	Thermal Resistance	Θ_{JA}	38	°C/W
	Plastic 132-Pin Surface Mount		49	
	Plastic 144-Pin Surface Mount			

The average chip-junction temperature (T_J) in C can be obtained from:

$$T_J = T_A + (P_D \times \Theta_{JA}) \quad (1)$$

where:

T_A = Ambient Temperature, °C

Θ_{JA} = Package Thermal Resistance, Junction-to-Ambient, °C/W

P_D = $P_{INT} + P_{I/O}$

P_{INT} = $I_{DD} \times V_{DD}$, Watts — Chip Internal Power

$P_{I/O}$ = Power Dissipation on Input and Output Pins — User Determined

For most applications $P_{I/O} < P_{INT}$ and can be neglected. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$P_D = K + (T_J + 273^\circ\text{C}) \quad (2)$$

Solving equations 1 and 2 for K gives:

$$K = P_D \times (T_A + 273^\circ\text{C}) + \Theta_{JA} \times P_D^2 \quad (3)$$

where K is a constant pertaining to the particular part. K can be determined from equation (3) by measuring P_D (at equilibrium) for a known T_A . Using this value of K, the values of P_D and T_J can be obtained by solving equations (1) and (2) iteratively for any value of T_A .

Table 4 Clock Control Timing

(V_{DD} and $V_{DDSYN} = 3.0$ to 3.6 Vdc, $V_{SS} = 0$ Vdc, $T_A = T_L$ to T_H)

Num	Characteristic	Symbol	Min	Max	Unit
1	PLL Reference Frequency Range	f_{ref}	20	50	kHz
2	System Frequency ¹ On-Chip PLL System Frequency External Clock Operation	f_{sys}	$4(f_{ref})$ dc	16.78 16.78	MHz
3	PLL Lock Time ^{2, 3, 4, 5}	t_{pll}	—	20	ms
4	VCO Frequency ⁶	f_{VCO}	—	$2 (f_{sys} \text{ max})$	MHz
5	CLKOUT Jitter ^{2, 3, 4, 7} Short term (5 μ s interval) Long term (500 μ s interval)	J_{clk}	-1.0 -0.5	1.0 0.5	%

NOTES:

- All internal registers retain data at 0 Hz.
- This parameter is periodically sampled rather than 100% tested.
- Assumes that a low-leakage external filter network is used to condition clock synthesizer input voltage. Total external resistance from the XFC pin due to external leakage must be greater than 15 M Ω to guarantee this specification. Filter network geometry can vary depending upon operating environment.
- Proper layout procedures must be followed to achieve specifications.
- Assumes that stable V_{DDSYN} is applied, and that the crystal oscillator is stable. Lock time is measured from the time V_{DD} and V_{DDSYN} are valid until \overline{RESET} is released. This specification also applies to the period required for PLL lock after changing the W and Y frequency control bits in the synthesizer control register (SYNCR) while the PLL is running, and to the period required for the clock to lock after LPSTOP.
- Internal VCO frequency (f_{VCO}) is determined by SYNCR W and Y bit values. The SYNCR X bit controls a divide-by-two circuit that is not in the synthesizer feedback loop. When $X = 0$, the divider is enabled, and $f_{sys} = f_{VCO} \div 4$. When $X = 1$, the divider is disabled, and $f_{sys} = f_{VCO} \div 2$. X must equal one when operating at maximum specified f_{sys} .
- Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{sys} . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the PLL circuitry via V_{DDSYN} and V_{SS} and variation in crystal oscillator frequency increase the J_{clk} percentage for a given interval. When jitter is a critical constraint on control system operation, this parameter should be measured during functional testing of the final system.

19	Load Capacitance ²	C_L	—	90	pF
	Group 1 I/O Pins, CLKOUT, FREEZE/QUOT, \overline{IPIPE}/DSO				
	Group 2 I/O Pins and \overline{CSBOOT} , $\overline{BG}/CS1$				
	Group 3 I/O Pins				
	Group 4 I/O Pins			100	

NOTES:

- Applies to:
QSM pins
 $\overline{IRQ}[7:1]$, \overline{RESET} , EXTAL, TSC, \overline{RMC} , $\overline{BKPT}/DSCLK$, \overline{IFETCH}/DSI
- Input-Only Pins: TSC, $\overline{BKPT}/DSCLK$, RXD
Output-Only Pins: \overline{CSBOOT} , $\overline{BG}/CS1$, CLKOUT, FREEZE/QUOT, \overline{IPIPE}/DSO
Input/Output Pins:
Group 1: DATA[15:0], \overline{IFETCH}/DSI
Group 2: ADDR[23:19]/CS[10:6], FC[2:0]/CS[5:3], $\overline{DSACK}[1:0]$, \overline{AVEC} , \overline{RMC} , \overline{DS} , \overline{AS} , SIZ[1:0]
 $\overline{IRQ}[7:1]$, MODCLK, ADDR[18:0], R/W, BERR, $\overline{BR}/CS0$, $\overline{BGACK}/CS2$, PCS[3:1], PCS0/ \overline{SS} , TXD
Group 3: \overline{HALT} , \overline{RESET}
Group 4: MISO, MOSI, SCK
- Does not apply to \overline{HALT} and \overline{RESET} because they are open drain pins.
Does not apply to Port QS[7:0] (TXD, PCS[3:1], PCS0/ \overline{SS} , SCK, MOSI, MISO) in wired-OR mode.
- Current measured at maximum system clock frequency.
- Total operating current is the sum of the appropriate V_{DD} supply and V_{DDSYN} supply current.
- When V_{SB} is more than 0.3V greater than V_{DD} , current flows between the V_{STBY} and V_{DD} pins, which causes standby current to increase toward the maximum condition specification. System noise on the V_{DD} and V_{STBY} pin can contribute to this condition.
- The SRAM module will not switch into standby mode as long as V_{SB} does not exceed V_{DD} by more than 0.5 volts. The SRAM array cannot be accessed while the module is in standby mode.
- Power dissipation measured at specified system clock frequency, all modules active. Power dissipation can be calculated using the expression:
$$P_D = 3.6V (I_{DDSYN} + I_{DD})$$

 I_{DD} includes supply currents for all device modules powered by V_{DD} pins
- Input capacitance is periodically sampled rather than 100% tested.

Table 6 16.78 MHz AC Timing (Continued)

(V_{DD} and $V_{DDSYN} = 3.0$ to 3.6 Vdc, $V_{SS} = 0$ Vdc, $T_A = T_L$ to T_H)¹

Num	Characteristic	Symbol	Min	Max	Unit
77	RESET Assertion Time ¹⁰	t _{RSTA}	4	—	t _{cyc}
78	RESET Rise Time ^{11, 12}	t _{RSTR}	—	10	t _{cyc}

NOTES:

- All AC timing is shown with respect to 2.0 V to 0.8 V levels unless otherwise noted.
- When an external clock is used, minimum high and low times are based on a 50% duty cycle. The minimum allowable t_{Xcyc} period is reduced when the duty cycle of the external clock varies. The relationship between external clock input duty cycle and minimum t_{Xcyc} is expressed:
Minimum t_{Xcyc} period = minimum t_{XCHL} / (50% – external clock input duty cycle tolerance).
- Specification 9A is the worst-case skew between AS and DS or CS. The amount of skew depends on the relative loading of these signals. When loads are kept within specified limits, skew will not cause AS and DS to fall outside the limits shown in specification 9.
- If multiple chip-selects are used, CS width negated (specification 15) applies to the time from the negation of a heavily loaded chip-select to the assertion of a lightly loaded chip select. The CS width negated specification between multiple chip-selects does not apply to chip selects being used for synchronous ECLK cycles.
- Hold times are specified with respect to DS or CS on asynchronous reads and with respect to CLKOUT on fast cycle reads. The user is free to use either hold time.
- Maximum value is equal to (t_{cyc} / 2) + 25 ns.
- If the asynchronous setup time (specification 47A) requirements are satisfied, the DSACK[1:0] low to data setup time (specification 31) and DSACK[1:0] low to BERR low setup time (specification 48) can be ignored. The data must only satisfy the data-in to clock low setup time (specification 27) for the following clock cycle. BERR must satisfy only the late BERR low to clock low setup time (specification 27A) for the following clock cycle.
- To ensure coherency during every operand transfer, BG is not asserted in response to BR until after all cycles of the current operand transfer are complete.
- In the absence of DSACK[1:0], BERR is an asynchronous input using the asynchronous setup time (specification 47A).
- After external RESET negation is detected, a short transition period (approximately 2) t_{cyc} elapses, then the SIM drives RESET low for 512 t_{cyc}.
- External assertion of the RESET input can overlap internally-generated resets. To insure that an external reset is recognized in all cases, RESET must be asserted for at least 590 CLKOUT cycles.
- External logic must pull RESET high during this period in order for normal MCU operation to begin.

B3	DSCLK Hold Time	t_{DSCCH}	10	—	ns
B4	DSO Delay Time	t_{DSOD}	—	25	ns
B5	DSCLK Cycle Time	t_{DSCCYC}	2	—	t_{cyc}
B6	CLKOUT Low to FREEZE Asserted/Negated	t_{FRZAN}	—	50	ns
B7	CLKOUT High to IFETCH High Impedance	t_{IPZ}	—	50	ns
B8	CLKOUT High to IFETCH Valid	t_{IP}	—	50	ns
B9	DSCLK Low Time	t_{DSCLO}	1	—	t_{cyc}

NOTES:

1. All AC timing is shown with respect to 20% V_{DD} and 70% V_{DD} levels unless otherwise noted.

Table 8 ECLK Bus Timing

(V_{DD} and $V_{DDSYN} = 3.0$ to 3.6 Vdc, $V_{SS} = 0$ Vdc, $T_A = T_L$ to T_H)¹

Num	Characteristic	Symbol	Min	Max	Unit
E1	ECLK Low to Address Valid ²	t_{EAD}	—	60	ns
E2	ECLK Low to Address Hold	t_{EAH}	15	—	ns
E3	ECLK Low to \overline{CS} Valid (\overline{CS} Delay)	t_{ECSD}	—	150	ns
E4	ECLK Low to \overline{CS} Hold	t_{ECSH}	15	—	ns
E5	\overline{CS} Negated Width	t_{ECSN}	30	—	ns
E6	Read Data Setup Time	t_{EDSR}	30	—	ns
E7	Read Data Hold Time	t_{EDHR}	5	—	ns
E8	ECLK Low to Data High Impedance	t_{EDHZ}	—	60	ns
E9	\overline{CS} Negated to Data Hold (Read)	t_{ECDH}	0	—	ns
E10	\overline{CS} Negated to Data High Impedance	t_{ECDZ}	—	1	t_{cyc}
E11	ECLK Low to Data Valid (Write)	t_{EDDW}	—	2	t_{cyc}
E12	ECLK Low to Data Hold (Write)	t_{EDHW}	15	—	ns
E13	Address Access Time (Read) ³	t_{EACC}	386	—	ns
E14	Chip-Select Access Time (Read) ⁴	t_{EACS}	296	—	ns
E15	Address Setup Time	t_{EAS}	1/2	—	t_{cyc}

NOTES:

1. All AC timing is shown with respect to 20% V_{DD} and 70% V_{DD} levels unless otherwise noted.
2. When previous bus cycle is not an ECLK cycle, the address may be valid before ECLK goes low.
3. Address access time = $t_{EACC} = t_{EAD} + t_{EDSR}$.
4. Chip select access time = $t_{EACS} = t_{ECSD} + t_{EDSR}$.

Table 9 QSPI Timing

(V_{DD} and $V_{DDSYN} = 3.0$ to 3.6 Vdc, $V_{SS} = 0$ Vdc, $T_A = T_L$ to T_H , 100 pF load on all QSPI pins)¹

Num	Function	Symbol	Min	Max	Unit
1	Operating Frequency Master Slave	f_{op}	DC	1/4	f_{sys}
			DC	1/4	f_{sys}
2	Cycle Time Master Slave	t_{qcyt}	4	510	t_{cyc}
			4	—	t_{cyc}
3	Enable Lead Time Master Slave	t_{lead}	2	128	t_{cyc}
			2	—	t_{cyc}
4	Enable Lag Time Master Slave	t_{lag}	—	1/2	SCK
			2	—	t_{cyc}
5	Clock (SCK) High or Low Time Master Slave ²	t_{sw}	$2 t_{cyc} - 60$	$255 t_{cyc}$	ns
			$2 t_{cyc} - n$	—	ns
6	Sequential Transfer Delay Master Slave (Does Not Require Deselect)	t_{td}	17	8192	t_{cyc}
			13	—	t_{cyc}
7	Data Setup Time (Inputs) Master Slave	t_{su}	30	—	ns
			20	—	ns
8	Data Hold Time (Inputs) Master Slave	t_{hi}	0	—	ns
			20	—	ns
9	Slave Access Time	t_a	—	1	t_{cyc}
10	Slave MISO Disable Time	t_{dis}	—	2	t_{cyc}
11	Data Valid (after SCK Edge) Master Slave	t_v	—	50	ns
			—	50	ns
12	Data Hold Time (Outputs) Master Slave	t_{ho}	0	—	ns
			0	—	ns
13	Rise Time Input Output	t_{ri} t_{ro}	—	2	μs
			—	30	ns
14	Fall Time Input Output	t_{fi} t_{fo}	—	2	μs
			—	30	ns

NOTES:

1. All AC timing is shown with respect to 20% V_{DD} and 70% V_{DD} levels unless otherwise noted.
2. For high time, $n =$ External SCK rise time; for low time, $n =$ External SCK fall time.

Table 10 Time Processor Unit Timing

(V_{DD} and $V_{DDA} = 3.0$ to $3.6V_{dc}$, $V_{SS} = 0 V_{dc}$, $T_A = T_L$ to T_H)¹

Num	Parameter	Symbol	Min	Max	Unit
1	CLKOUT High to TPU Output Channel Valid ^{2, 3, 4}	t_{CHTOV}	2	23	ns
2	CLKOUT High to TPU Output Channel Hold	t_{CHTOH}	0	20	ns
3	TPU Input Channel Pulse Width	t_{TIPW}	4	—	t_{cyc}

NOTES:

1. AC Timing is shown with respect to 20% V_{DD} and 70% V_{DD} levels.
2. Timing not valid for external T2CLK input.
3. Maximum load capacitance for CLKOUT pin is 90 pF.
4. Maximum load capacitance for TPU output pins is 100 pF.
