48-LQFP  
Case 932-03

32-LQFP  
Case 873A-03

28-SOIC  
Case 751F-05

### Features

- 8-Bit HCS08 Central Processor Unit (CPU)
  - Up to 51.34 MHz CPU at 2.7V to 5.5V across temperature range of  $-40^{\circ}\text{C}$  to  $105^{\circ}\text{C}$
  - Up to 40 MHz CPU at 2.7V to 5.5V across temperature range of  $-40^{\circ}\text{C}$  to  $125^{\circ}\text{C}$
  - HC08 instruction set with added BGND instruction and additional addressing modes for LDHX and STHX
  - Support for up to 48 interrupt/reset sources
- On-Chip Memory
  - Up to 16 KB flash memory; read/program/erase over full operating voltage and temperature
  - Up to 1 KB random-access memory (RAM)
  - Security circuitry to prevent unauthorized access to RAM and flash memory contents
- Power-Saving Modes
  - Two low power stop modes; reduced power wait mode
  - Peripheral clock gating can disable clocks to unused modules
- Clock Source Options
  - Oscillator (XOSC) — Loop-control Pierce oscillator; Crystal or ceramic resonator range of 31.25–38.4 kHz or 1–16 MHz
  - Internal Clock Source (ICS) — Containing a frequency-locked-loop (FLL) controlled by internal or external reference; precision trimming of internal reference allows 0.2% resolutions and 2% deviation over temperature and voltage; supports CPU frequencies up to 51.34 MHz
- System Protection
  - Watchdog computer operating properly (COP) reset running from dedicated 1-kHz internal clock source or bus clock
  - Low-voltage detection with reset or interrupt; selectable trip points
  - Illegal opcode and illegal address detection with reset
  - Flash memory block protection
- Development Support
  - Single-wire background debug interface
  - Breakpoint capability to allow single breakpoint setting during in-circuit debugging (plus three more breakpoints in on-chip debug module)
  - On-chip in-circuit emulator (ICE) debug module containing three comparators and nine trigger modes. Eight deep FIFO for storing change-of-flow addresses and event-only data. Debug module supports both tag and force breakpoints
- Peripherals
  - **IPC** — Interrupt Priority Controller with 4 programmable interrupt priority levels
  - **ADC** — 13-channel, 12-bit resolution; 2.5  $\mu\text{s}$  conversion time; automatic compare function; 1.7 mV/ $^{\circ}\text{C}$  temperature sensor; internal bandgap reference channel; operation in stop3
- **PGA** — Differential programmable gain amplifier with programmable gain (x1, x2, x4, x8, x16, or x32)
- **HSCMP** — Three fast analog comparators with positive and negative inputs; separately selectable interrupt on rising and falling comparator output; filtering; windowing; HSCMP1 and HSCMP2 outputs can be optionally routed to FTM1 module; runs in stop3
- **DAC** — Three 5-bit digital to analog convertor used as a 32-tap voltage reference for each comparator
- **PDB** — Two programmable delay blocks: PDB1 synchronizes PWM with samples of ADC; PDB2 synchronizes PWM with comparing window of analog comparators
- **SCI** — Full duplex non-return to zero (NRZ); LIN master extended break generation; LIN slave extended break detection; wake up on active edge
- **SPI** — Full-duplex or single-wire bidirectional; Double-buffered transmit and receive; Master or Slave mode; MSB-first or LSB-first shifting
- **IIC/SMBus** — Up to 400 kbps; Multi-master operation; Programmable slave address; Interrupt driven byte-by-byte data transfer; supports broadcast mode and 10-bit addressing; SMBus compatible
- **FTM** — Two Fleximers with total of 8 channels; One 2-channel (FTM1) and one 6-channel (FTM2); supports operation up to 2x bus clock; selectable input capture, output compare, edge- or center-aligned PWM; dead time insertion; fault inputs
- **MTIM** — 8-bit modulo counter with 8-bit prescaler
- **RTC** — (Real-time counter) 8-bit modulus counter with binary or decimal based prescaler; External clock source for precise time base, time-of-day, calendar or task scheduling; Free running on-chip low power oscillator (1 kHz) for cyclic wake-up without external components, runs in all MCU modes
- **CRC** — Cyclic redundancy check generator
- **KBI** — Three 8 channel keyboard interrupt module with software selectable polarity on edge or edge/level modes
- Input/Output
  - 40 GPIOs, 2 output-only pins.
  - Hysteresis and configurable pull up device on input pins; Configurable slew rate and drive strength on output pins; Sink/Source current up to 20mA
- Package Options
  - 48-LQFP, 32-LQFP, 28-SOIC
  - 48-LQFP qualified for automotive usage

**Notes:** When PTF1 is configured as  $\overline{\text{RESET}}$ , pin becomes bi-directional with output being open-drain drive containing an internal pull-up device.  
 When PTF0 is configured as BKGD, pin becomes bi-directional.  
 $V_{DD2}$  pad is tied internally on 32-pin and 28-pin packages,  
 $V_{SS2}$  pad is tied internally on 28-pin packages

<sup>1</sup> TCLK pin can be repositioned using TCLKPS in SOPT2. Default reset location is PTC7.

<sup>2</sup> HSCMP2 output CMP2OUT can be repositioned using the CMP2OPS in the SOPT2 register. Default reset location is PTD6.

<sup>3</sup> HSCMP3 output CMP3OUT can be repositioned using the CMP3OPS in the SOPT2 register. Default reset location is PTD7.

<sup>4</sup> Pin is open drain with an internal pullup that is always enabled. Pin does not contain a clamp diode to V<sub>DD</sub> and should not be driven above V<sub>DD</sub>. The voltage measured on the internally pulled up  $\overline{\text{RESET}}$  will not be pulled to V<sub>DD</sub>. The internal gates connected to this pin are pulled to V<sub>DD</sub>.

<sup>5</sup> IIC pins SDA and SCL can be repositioned using IICPS in SOPT2. Default reset locations are PTD0 and PTD1.

<sup>6</sup> If ADC, HSCMP, or PGA is enabling a shared analog input pin, each has access to the pin.

## 2 Electrical Characteristics

### 2.1 Introduction

This section contains electrical and timing specifications for the MC9S08MP16 Series of microcontrollers available at the time of publication.

## 2.2 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

**Table 2. Parameter Classifications**

<b>P</b>	Those parameters that are guaranteed during production testing on each individual device.
<b>C</b>	Those parameters that are achieved by the design characterization by measuring a statistically relevant sample size across process variations.
<b>T</b>	Those parameters that are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category.
<b>D</b>	Those parameters that are derived mainly from simulations.

### NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

## 2.3 Absolute Maximum Ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in [Table 3](#) may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this section.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either  $V_{SS}$  or  $V_{DD}$ ) or the programmable pull-up resistor associated with the pin is enabled.

**Table 3. Absolute Maximum Ratings**

Rating	Symbol	Value	Unit
Supply voltage	$V_{DD}$	-0.3 to +5.8	V
Maximum current into $V_{DD}$	$I_{DD}$	120	mA
Digital input voltage	$V_{In}$	-0.3 to $V_{DD} + 0.3$	V
Instantaneous maximum current Single pin limit (applies to all port pins) <sup>1, 2, 3</sup>	$I_D$	$\pm 25$	mA
Storage temperature range	$T_{stg}$	-55 to 150	°C

<sup>1</sup> Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive ( $V_{DD}$ ) and negative ( $V_{SS}$ ) clamp voltages, then use the larger of the two resistance values.

<sup>2</sup> All functional non-supply pins, except for PTF1/RESET are internally clamped to  $V_{SS}$  and  $V_{DD}$ .

<sup>3</sup> Power supply must maintain regulation within operating  $V_{DD}$  range during instantaneous and operating maximum current conditions. If positive injection current ( $V_{In} > V_{DD}$ ) is greater than  $I_{DD}$ , the injection current may flow out of  $V_{DD}$  and could result in external power supply going out of regulation. Ensure external  $V_{DD}$  load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if the clock rate is very low (which would reduce overall power consumption).

## 2.4 Thermal Characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and voltage regulator circuits, and it is user-determined rather than being controlled by the MCU design. To take  $P_{I/O}$  into account in power calculations, determine the difference between actual pin voltage and  $V_{SS}$  or  $V_{DD}$  and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and  $V_{SS}$  or  $V_{DD}$  will be very small.

**Table 4. Thermal Characteristics**

Num	C	Rating	Symbol	Consumer & Industrial	Automotive	Unit
1	—	Operating temperature range (packaged)	$T_A$	–40 to 105	–40 to 125	°C
2	D	Maximum junction temperature	$T_J$	115	135	°C
3	D	Thermal resistance <sup>1,2</sup> single-layer board	$\theta_{JA}$	80	80	°C/W
		48-pin LQFP		85	—	
		32-pin LQFP		71	—	
		28-pin SOIC				
4	D	Thermal resistance <sup>1,2</sup> four-layer board	$\theta_{JA}$	56	56	°C/W
		48-pin LQFP		57	—	
		32-pin LQFP		48	—	
		28-pin SOIC				

<sup>1</sup> Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.

<sup>2</sup> Junction-to-ambient natural convection

The average chip-junction temperature ( $T_J$ ) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA}) \quad \text{Eqn. 1}$$

where:

$T_A$  = Ambient temperature, °C

$\theta_{JA}$  = Package thermal resistance, junction-to-ambient, °C/W

$P_D = P_{int} + P_{I/O}$

$P_{int} = I_{DD} \times V_{DD}$ , Watts — chip internal power

$P_{I/O}$  = Power dissipation on input and output pins — user determined

For most applications,  $P_{I/O} \ll P_{int}$  and can be neglected. An approximate relationship between  $P_D$  and  $T_J$  (if  $P_{I/O}$  is neglected) is:

$$P_D = K \div (T_J + 273^\circ\text{C}) \quad \text{Eqn. 2}$$

Solving Equation 1 and Equation 2 for K gives:

$$K = P_D \times (T_A + 273^\circ\text{C}) + \theta_{JA} \times (P_D)^2 \quad \text{Eqn. 3}$$

where K is a constant pertaining to the particular part. K can be determined from equation 3 by measuring  $P_D$  (at equilibrium) for a known  $T_A$ . Using this value of K, the values of  $P_D$  and  $T_J$  can be obtained by solving Equation 1 and Equation 2 iteratively for any value of  $T_A$ .

## 2.5 ESD Protection and Latch-Up Immunity

Although damage from electrostatic discharge (ESD) is much less common on these devices than on early CMOS circuits, normal handling precautions should be taken to avoid exposure to static discharge. Qualification tests are performed to ensure that these devices can withstand exposure to reasonable levels of static without suffering any permanent damage.

All ESD testing is in conformity with AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits. During the device qualification, ESD stresses were performed for the human body model (HBM) and the charge device model (CDM).

A device is defined as a failure if after exposure to ESD pulses the device no longer meets the device specification. Complete DC parametric and functional testing is performed per the applicable device specification at room temperature followed by hot temperature, unless instructed otherwise in the device specification.

**Table 5. ESD and Latch-up Test Conditions**

Model	Description	Symbol	Value	Unit
Human Body	Series resistance	R1	1500	$\Omega$
	Storage capacitance	C	100	pF
	Number of pulses per pin	—	3	
Latch-up	Minimum input voltage limit		-2.5	V
	Maximum input voltage limit		7.5	V

**Table 6. ESD and Latch-Up Protection Characteristics**

No.	Rating <sup>1</sup>	Symbol	Min	Max	Unit
1	Human body model (HBM)	$V_{HBM}$	$\pm 2000$	—	V
2	Charge device model (CDM)	$V_{CDM}$	$\pm 500$	—	V
3	Latch-up current at $T_A = 105^\circ\text{C}$	$I_{LAT}$	$\pm 100$	—	mA

<sup>1</sup> Parameter is achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted.

## 2.6 DC Characteristics

<sup>3</sup> When keyboard interrupt is configured to detect rising edges, pulldown resistors are used in place of pullup resistors.

<sup>4</sup> The specified resistor value is the actual value internal to the device. The pullup value may measure higher when measured externally on the pin.

<sup>5</sup> Power supply must maintain regulation within operating  $V_{DD}$  range during instantaneous and operating maximum current conditions. If positive injection current ( $V_{in} > V_{DD}$ ) is greater than  $I_{DD}$ , the injection current may flow out of  $V_{DD}$  and could result in external power supply going out of regulation. Ensure external  $V_{DD}$  load will shunt current greater than maximum injection current. This will be the greatest risk when the MCU is not consuming power. Examples are: if no system clock is present, or if clock rate is very low (which would reduce overall power consumption).

<sup>6</sup> Input must be current limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.

## Electrical Characteristics

- <sup>7</sup> All functional non-supply pins except PTF1/RESET are internally clamped to  $V_{SS}$  and  $V_{DD}$ .
- <sup>8</sup> The PTF1/RESET pin does not have a clamp diode to  $V_{DD}$ . Do not drive this pin above  $V_{DD}$ .
- <sup>9</sup> Maximum is highest voltage that POR is guaranteed.
- <sup>10</sup> Factory trimmed at  $V_{DD} = 5.0\text{ V}$

<sup>1</sup> Typical values are based on characterization data at 25°C. See Figure 9 through Figure 14 for typical curves across temperature and voltage.

<sup>2</sup> Max values in this column apply for the full operating temperature range of the device unless otherwise noted.

<sup>3</sup> All modules except ADC active, ICS configured for FBELP, and does not include any dc loads on port pins

<sup>4</sup> All modules except ADC active, ICS configured for FEI, and does not include any dc loads on port pins

<sup>5</sup> All modules except ADC active, ICS configured for FEI, and does not include any dc loads on port pins

<sup>6</sup> Stop currents are tested in production for 25°C on all parts. Tests at other temperatures depend upon the part number suffix and maturity of the product. Freescale may eliminate a test insertion at a particular temperature from the production test flow once sufficient data has been collected and is approved.

<sup>7</sup> Most customers are expected to find that auto-wakeup from stop2 or stop3 can be used instead of the higher current wait mode.

11	C	Long term jitter of DCO output clock (averaged over 2-ms interval) <sup>4</sup>	$C_{Jitter}$	—	0.02	0.2	% $f_{dco}$

<sup>1</sup> Data in Typical column was characterized at 3.0 V, 25°C or is typical recommended value.

<sup>2</sup> The resulting bus clock frequency should not exceed the maximum specified bus clock frequency of the device.

<sup>3</sup> This specification applies to any time the FLL reference source or reference divider is changed, trim value changed or changing from FLL disabled (FBELP, FBILP) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.

<sup>4</sup> Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum  $f_{Bus}$ . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via  $V_{DD}$  and  $V_{SS}$  and variation in crystal oscillator frequency increase the  $C_{Jitter}$  percentage for a given interval.

- <sup>1</sup> Typical values are based on characterization data at  $V_{DD} = 5.0V, 25^{\circ}C$  unless otherwise stated.
- <sup>2</sup> This is the shortest pulse that is guaranteed to be recognized as a reset pin request.
- <sup>3</sup> To enter BDM mode following a POR, BKGD/MS should be held low during the power-up and for a hold time of  $t_{MSH}$  after  $V_{DD}$  rises above  $V_{LVD}$ .
- <sup>4</sup> This is the minimum pulse width that is guaranteed to be recognized as a keyboard interrupt request in stop mode.
- <sup>5</sup> This is the minimum pulse width that is guaranteed to pass through the pin synchronization circuitry. Shorter pulses may or may not be recognized. In stop mode, the synchronizer is bypassed so shorter pulses can be recognized in that case.
- <sup>6</sup> Timing is shown with respect to 20%  $V_{DD}$  and 80%  $V_{DD}$  levels. Temperature range  $-40^{\circ}C$  to  $125^{\circ}C$ .

### 2.14.2 FTM Module Timing

Synchronizer circuits determine the shortest input pulses that can be recognized or the fastest clock that can be used as the optional external source to the FTM timer counter. These synchronizers operate from the current ICSOUT clock. The ICSOUT clock period =  $0.5 \times t_{cyc} = 1/(f_{Bus} \times 2)$ .

## 2.15 Flash Memory Specifications

This section provides details about program/erase times and program-erase endurance for the flash memory.

Program and erase operations do not require any special power sources other than the normal  $V_{DD}$  supply. For more detailed information about program/erase operations, see the Memory section.

**Table 20. Flash Memory Characteristics**

Num	C	Characteristic	Symbol	Min	Typical	Max	Unit
1	—	Supply voltage for program/erase -40°C to 125°C	$V_{\text{prog/erase}}$	2.7		5.5	V
2	—	Supply voltage for read operation	$V_{\text{Read}}$	2.7		5.5	V

12	C	Data retention <sup>5</sup>	$t_{\text{D\_ret}}$	15	100	—	years

<sup>1</sup> The frequency of this clock is controlled by a software setting.

<sup>2</sup> These values are hardware state machine controlled. User code does not need to count cycles. This information supplied for calculating approximate time to program and erase.

<sup>3</sup> The program and erase currents are additional to the standard run  $I_{DD}$ . These values are measured at room temperatures with  $V_{DD} = 5.0$  V, bus frequency = 4.0 MHz.

<sup>4</sup> **Typical endurance for Flash** is based upon the intrinsic bit cell performance. For additional information on how Freescale defines typical endurance, please refer to Engineering Bulletin EB619/D, *Typical Endurance for Nonvolatile Memory*.

<sup>5</sup> **Typical data retention** values are based on intrinsic capability of the technology measured at high temperature and de-rated to 25°C using the Arrhenius equation. For additional information on how Freescale defines typical data retention, please refer to Engineering Bulletin EB618/D, *Typical Data Retention for Nonvolatile Memory*.

## 2.16 EMC Performance

Electromagnetic compatibility (EMC) performance is highly dependant on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components as well as MCU software operation all play a significant role in EMC performance. The system designer should consult Freescale applications notes such as AN2321, AN1050, AN1263, AN2764, and AN1259 for advice and guidance specifically targeted at optimizing EMC performance.

### 2.16.1 Radiated Emissions

Microcontroller radiated RF emissions are measured from 150 kHz to 1 GHz using the TEM/GTEM Cell method in accordance with the IEC 61967-2 and SAE J1752/3 standards. The measurement is performed with the microcontroller installed on a

custom EMC evaluation board while running specialized EMC test software. The radiated emissions from the microcontroller are measured in a TEM cell in two package orientations (North and East).

The maximum radiated RF emissions of the tested configuration in all orientations are less than or equal to the reported emissions levels.

**Table 21. Radiated Emissions, Electric Field**

Parameter	Symbol	Conditions	Frequency	$f_{osc}/f_{BUS}$	Level <sup>1</sup> (Max)	Unit

<sup>1</sup> Data based on qualification test results. The reported emission level is the value of the maximum emission, rounded up to the next whole number, from among the measured orientations in each frequency range.

<sup>2</sup> IEC level maximums: N  $\leq$  12 dB $\mu$ V, L  $\leq$  24 dB $\mu$ V, I  $\leq$  36 dB $\mu$ V

<sup>3</sup> SAE level maximums: 1  $\leq$  10 dB $\mu$ V, 2  $\leq$  20 dB $\mu$ V, 3  $\leq$  30 dB $\mu$ V, 4  $\leq$  40 dB $\mu$ V
