## FEATURES

Single-supply operation: 4.5 V to 33 V
Input common-mode includes ground
Output swings to ground
High slew rate: $3 \mathrm{~V} / \mu \mathrm{s}$
High gain bandwidth: 4 MHz
Low input offset voltage
High open-loop gain
No phase inversion

## APPLICATIONS

## Disk drives

Mobile phones
Servo controls
Modems and fax machines

## Pagers

Power supply monitors and controls
Battery-operated instrumentation

## GENERAL DESCRIPTION

The OP292/OP492 are low cost, general-purpose dual and quad operational amplifiers designed for single-supply applications and are ideal for 5 V systems.
Fabricated on Analog Devices, Inc., CBCMOS process, the OP292/OP492 series has a PNP input stage that allows the input voltage range to include ground. A BiCMOS output stage enables the output to swing to ground while sinking current.

## PIN CONFIGURATIONS

Figure 1. 8-Lead Narrow-Body SOIC (S-Suffix)

Figure 2. 14-Lead Narrow-Body SOIC (S-Suffix)

The OP292/OP492 series is unity-gain stable and features an outstanding combination of speed and performance for singleor dual-supply operation. The OP292/OP492 provide a high slew rate, high bandwidth, with open-loop gain exceeding 40,000 and offset voltage under $800 \Omega$ (OP292) and 1 mV (OP492). With these combinations of features and low supply current, the OP292/OP492 series is an excellent choice for battery-operated applications.

The OP292/OP492 series performance is specified for single- or dual-supply voltage operation over the extended industrial temperature range $\left(-40^{\circ} \mathrm{C}\right.$ to $\left.+125^{\circ} \mathrm{C}\right)$.

## OP292/OP492

## ABSOLUTE MAXIMUM RATINGS

Table 3.

| Parameter | Rating |
| :--- | :--- |
| Supply Voltage | 33 V |
| Input Voltage Range ${ }^{1}$ | -15 V to +14 V |
| Differential Input Voltage ${ }^{1}$ | $\mathrm{~V}^{1}$ |
| Output Short-Circuit Duration | Unlimited |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Junction Temperature Range | $-65^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Lead Temperature Range (Soldering, 60 sec ) | $300^{\circ} \mathrm{C}$ |

${ }^{1}$ For supply voltages less than 36 V , the absolute maximum input voltage is equal to the supply voltage.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

$\theta_{\text {JA }}$ is specified for the worst-case conditions, that is, a device soldered in the circuit board for the surface-mount packages.

Table 4. Thermal Resistance

| Package Type | $\boldsymbol{\theta}_{\mathbf{J A}}$ | $\boldsymbol{\theta}_{\mathbf{\prime}}$ | Unit |
| :--- | :--- | :--- | :--- |
| 8-Lead SOIC | 158 | 43 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| 14-Lead SOIC | 120 | 36 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## OP292/0P492

## APPLICATIONS INFORMATION

## PHASE REVERSAL

The OP492 has built-in protection against phase reversal when the input voltage goes to either supply rail. In fact, it is safe for the input to exceed either supply rail by up to 0.6 V with no risk of phase reversal. However, the input should not go beyond the positive supply rail by more than 0.9 V ; otherwise, the output will reverse phase. If this condition occurs, the problem can be fixed by adding a $5 \mathrm{k} \Omega$ current limiting resistor in series with the input pin. With this addition, the input can go to more than 5 V beyond the positive rail without phase reversal.
An input voltage that is as much as 5 V below the negative rail will not result in phase reversal.

Figure 34. Output Phase Reverse If Input Exceeds the Positive Supply $(\mathrm{V}+)$ by More Than 0.9 V

Figure 35. No Negative Rail Phase Reversal, Even with Input Signal at 5 V Below Ground

## POWER SUPPLY CONSIDERATIONS

The OP292/OP492 are designed to operate equally well at single +5 V or $\pm 15 \mathrm{~V}$ supplies. The lowest supply voltage recommended is 4.5 V .

It is a good design practice to bypass the supply pins with a $0.1 \mu \mathrm{~F}$ ceramic capacitor. It helps improve filtering of high frequency noise.
For dual-supply operation, the negative supply (V-) must be applied at the same time, or before $\mathrm{V}+$. If $\mathrm{V}+$ is applied before $\mathrm{V}-$, or in the case of a loss of the V - supply, while either input is connected to ground or another low impedance source, excessive input current may result. Potentially damaging levels of input current can destroy the amplifier. If this condition can exist, simply add a $1 \mathrm{k} \Omega$ or larger resistor in series with the input to eliminate the problem.

## OP292/0P492

## TYPICAL APPLICATIONS

## DIRECT ACCESS ARRANGEMENT FOR TELEPHONE LINE INTERFACE

Figure 36 shows a 5 V single-supply transmit/receive telephone line interface for a modem circuit. It allows full duplex transmission of modem signals on a transformer-coupled 600 V line in a differential manner. The transmit section gain can be set for the specific modem device output. Similarly, the receive amplifier gain can be appropriately selected based on the modem device input requirements. The circuit operates on a single 5 V supply. The standard value resistors allow the use of a SIP-packaged resistor array; coupled with a quad op amp in a single package, this offers a compact, low part count solution.

Figure 36. Universal Direct Access Arrangement for Telephone Line Interface

## SINGLE-SUPPLY INSTRUMENTATION AMPLIFIER

A low cost, single-supply instrumentation amplifier can be built as shown in Figure 37. The circuit uses two op amps to form a high input impedance differential amplifier. Gain can be set by selecting resistor $\mathrm{R}_{\mathrm{G}}$, which can be calculated using the transfer function equation. Normally, $\mathrm{V}_{\text {ref }}$ is set to 0 V . Then the output voltage is a function of the gain times the differential input voltage. However, the output can be offset by setting $V_{\text {ref }}$ from 0 V to 4 V , as long as the input common-mode voltage of the amplifier is not exceeded.

Figure 37. Single-Supply Instrumentation Amplifier
In this configuration, the output can swing to near 0 V ; however, be careful because the common-mode voltage range of the input cannot operate to 0 V . This is because of the limitation of the circuit configuration where the first amplifier must be able to swing below ground to attain a 0 V common-mode voltage, which it cannot do. Depending on the gain of the instrumentation amplifier, the input common-mode extends to within about 0.3 V of zero. The worst-case common-mode limit for a given gain can be easily calculated.

## DAC OUTPUT AMPLIFIER

The OP292/OP492 are ideal for buffering the output of singlesupply DACs. Figure 38 shows a typical amplifier used to buffer the output of a CMOS DAC that is connected for single-supply operation. To do that, the normally current output 12-bit CMOS DAC ( $\mathrm{R}-2 \mathrm{R}$ ladder type) is connected backward to produce a voltage output. This operating configuration necessitates a low voltage reference. In this case, a 1.235 V low power reference is used. The relatively high output impedance ( $10 \mathrm{k} \Omega$ ) is buffered by the OP292, and at the same time, gained up to a much more usable level. The potentiometer provides an accurate gain trim for a 4.095 V full-scale, allowing 1 mV increment per LSB of control resolution.

The DAC8043 device comes in an 8-lead PDIP package, providing a cost-effective, compact solution to a 12 -bit analog channel.

## $50 \mathrm{~Hz} / 60 \mathrm{~Hz}$ SINGLE-SUPPLY NOTCH FILTER

Figure 39 shows a notch filter that achieves nearly 30 dB of 60 Hz rejection while powered by only a single 12 V supply. The circuit also works well on 5 V systems. The filter uses a twin-T configuration, whose frequency selectivity depends heavily on the relative matching of the capacitors and resistors in the twin- T section. Mylar is a good choice for the capacitors of the twin- T , and the relative matching of the capacitors and resistors determines the pass-band symmetry of the filter. Using $1 \%$ resistors and 5\% capacitors produces satisfactory results.
The amount of rejection and the Q of the filter is solely determined by one resistor and is shown in the table with Figure 39. The bottom amplifier is used to split the supply to bias the amplifier to midlevel. The circuit can be modified to reject 50 Hz by simply changing the resistors in the twin- T section ( Rl through R 4 ) from $2.67 \mathrm{k} \Omega$ to $3.16 \mathrm{k} \Omega$ and by changing $R 5$ to $1 / 2$ of $3.16 \mathrm{k} \Omega$. For best results, the common value resistors can be from a resistor array for optimum matching characteristics.

NOTES

1. FOR 50 Hz APPLICATION CHANGE R12 TO R4 TO $3.16 \mathrm{k} \Omega$ AND R5 TO $1.58 \mathrm{k} \Omega(3.16 \mathrm{k} \Omega \div 2)$

## FOUR-POLE BESSEL LOW-PASS FILTER

The linear phase filter in Figure 40 is designed to roll off at a voice-band cutoff frequency of 3.6 kHz . The four poles are formed by two cascading stages of 2-pole Sallen-Key filters.

Figure 40. Four-Pole Bessel Low-Pass Filter Using Sallen-Key Topology

## LOW COST, LINEARIZED THERMISTOR AMPLIFIER

An inexpensive thermometer amplifier circuit can be implemented using low cost thermistors. One such implementation is shown in Figure 41. The circuit measures temperature over the range of $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$ to an accuracy of $\pm 0.3^{\circ} \mathrm{C}$ as the linearization circuit works well within a narrow temperature range. However, it can measure higher temperatures but at a slightly reduced accuracy. To achieve the aforementioned accuracy, the nonlinearity of the thermistor must be corrected. This is done by connecting the thermistor in parallel with the $10 \mathrm{k} \Omega$ in the feedback loop of the first stage amplifier. A constant operating current of $281 \mu \mathrm{~A}$ is supplied by the resistor R1 with the 5 V reference from the REF195 such that the self-heating error of the thermistor is kept below $0.1^{\circ} \mathrm{C}$.

In many cases, the thermistor is placed some distance from the signal conditioning circuit. Under this condition, a $0.1 \mu \mathrm{~F}$ capacitor placed across R2 will help to suppress noise pickup.
This linearization network creates an offset voltage that is corrected by summing a compensating current with Potentiometer P1. The temperature dependent signal is amplified by the second stage, producing a transfer coefficient of $-10 \mathrm{mV} /{ }^{\circ} \mathrm{C}$ at the output.
To calibrate, a precision decade box can be used in place of the thermistor. For $0^{\circ} \mathrm{C}$ trim, the decade box is set to $32.650 \mathrm{k} \Omega$, and $P 1$ is adjusted until the output of the circuit reads 0 V . To trim the circuit at the full-scale temperature of $70^{\circ} \mathrm{C}$, the decade box is then set to $1.752 \mathrm{k} \Omega$, and P 2 is adjusted until the circuit reads -0.70 V .

## OP292/OP492

## SINGLE-SUPPLY ULTRASONIC CLAMPING/LIMITING RECEIVER AMPLIFIER

Figure 42 shows an ultrasonic receiver amplifier using the nonlinear impedance of low cost diodes to effectively control the gain for wide dynamic range. This circuit amplifies a 40 kHz ultrasonic signal through a pair of low cost clamping amplifiers before feeding a band-pass filter to extract a clean 40 kHz signal for processing.
The signal is ac-coupled into the false-ground bias node by virtue of the capacitive piezoelectric sensing element. Rather than using an amplifier to generate a supply splitting bias, the false ground voltage is generated by a low cost resistive voltage divider.

Each amplifier stage provides ac gain while passing on the dc self-bias. As long as the output signal at each stage is less than the forward voltage of a diode, each amplifier has unrestricted gain to amplify low level signals. However, as the signal strength increases, the feedback diodes begin to conduct, shunting the feedback current, and thus reducing the gain. Although distorting the waveform, the diodes effectively maintain a relatively constant amplitude even with large signals that otherwise would saturate the amplifier. In addition, this design is considerably more stable than the feedback type AGC.

The overall circuit has a gain range from -2 to -400 , where the inversion comes from the band-pass filter stage. Operating with a Q of 5, the filter restores a clean, undistorted signal to the output. The circuit also works well with 5 V supply systems.

Figure 42.40 kHz Ultrasonic Clamping/Limiting Receiver Amplifier

## PRECISION SINGLE-SUPPLY VOLTAGE COMPARATOR

The OP292/OP492 have excellent overload recovery characteristics, making them suitable for precision comparator applications. Figure 43 shows the saturation recovery characteristics of the OP492. The amplifier exhibits very little propagation delay. The amplifier compares a signal to precisely $<0.5 \mathrm{mV}$ offset error.

Figure 43. OP492 Has Fast Overload Recovery for Comparator Applications

## PROGRAMMABLE PRECISION WINDOW COMPARATOR

The OP292/OP492 can be used for precise level detection, such as in test equipment where a signal is measured within a range (see Figure 44). A pair of 12 -bit DACs sets the threshold voltage level. The DACs have serial interface, which minimizes interconnection requirements. The DAC8512 has a control resolution of $1 \mathrm{mV} / \mathrm{bit}$. Therefore, for 5 V supply operation, the maximum DAC output is 4.095 V . However, the OP292 accepts a maximum input of 4.0 V .
