

Low power quad operational amplifier

Features

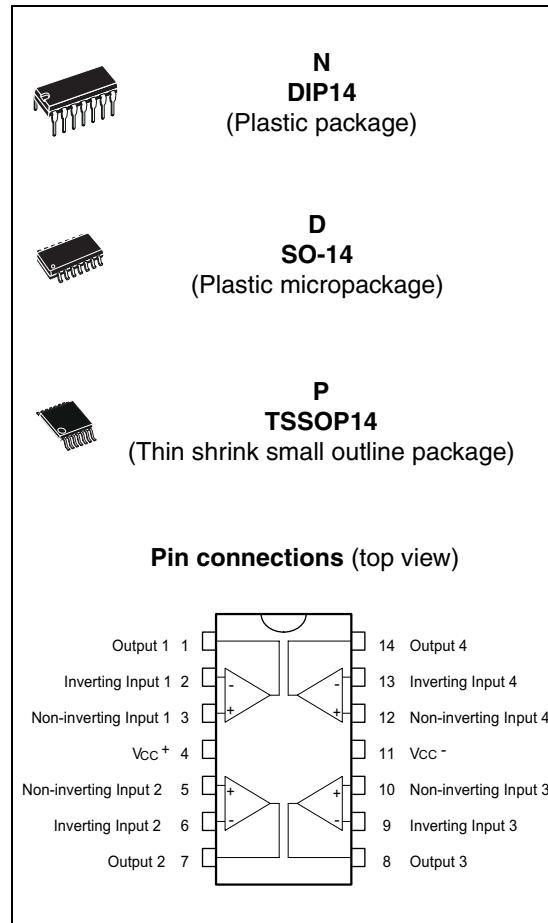

- Wide gain bandwidth: 1.3 MHz
- Input common-mode voltage range includes negative rail
- Large voltage gain: 100 dB
- Very low supply current per amp: 375 μ A
- Low input bias current: 20 nA
- Low input offset current: 2 nA
- ESD internal protection: 800 V
- Wide power supply range
- Single supply: +3 V to +30 V
- Dual supplies: \pm 1.5 V to \pm 15 V

Description

This circuit consists of four independent, high-gain, internally frequency-compensated operational amplifiers designed especially for automotive and industrial control systems.

It operates from a single power supply over a wide range of voltages. Operation from split power supplies is also possible and the low power supply current drain is independent of the magnitude of the power supply voltage.

All the pins are protected against electrostatic discharges up to 800 V.

1 Absolute maximum ratings and operating conditions

Table 1. Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage	± 16 to 32	V
V_{id}	Differential input voltage	+32	V
V_i	Input voltage	-0.3 to V_{CC}^+ + 0.3	V
	Output short-circuit to ground ⁽¹⁾	Infinite	
I_{in}	Input current ⁽²⁾	50	mA
T_{stg}	Storage temperature range	-65 to +150	°C
R_{thja}	Thermal resistance junction to ambient ⁽³⁾ SO-14 TSSOP14 DIP14	105 100 80	°C/W
R_{thjc}	Thermal resistance junction to case ⁽³⁾ SO-14 TSSOP14 DIP14	31 32 33	°C/W
ESD	HBM: human body model ⁽⁴⁾	800	V
	MM: machine model ⁽⁵⁾	100	V
	CDM: charged device model ⁽⁶⁾	1500	V

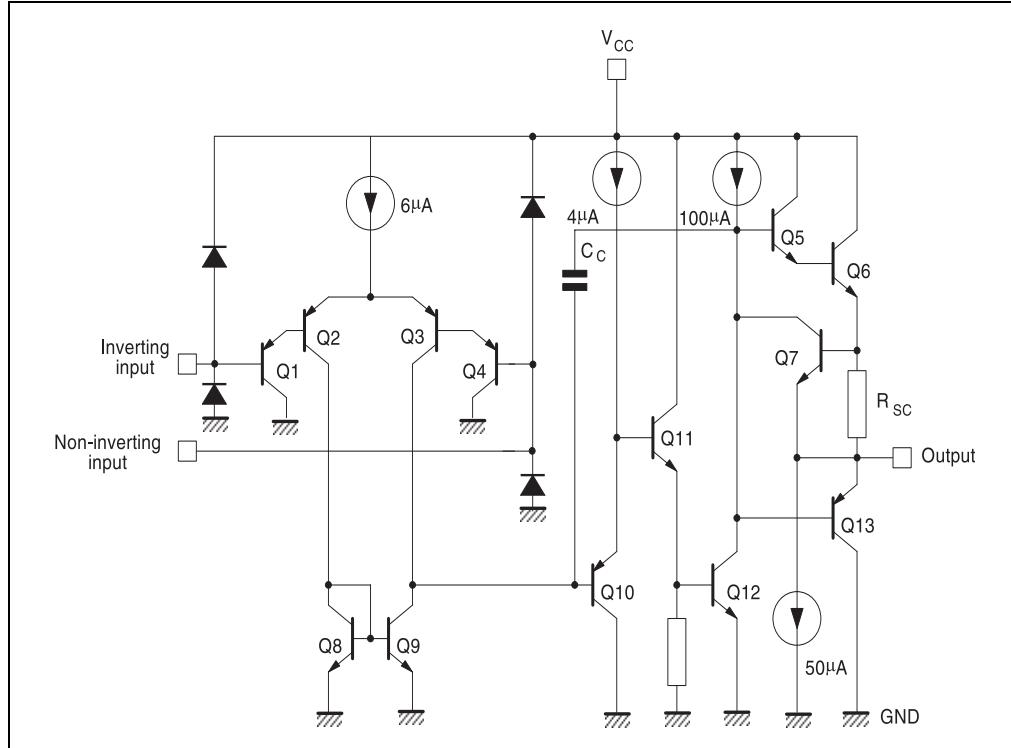

- Short-circuits from the output to V_{CC}^+ can cause excessive heating and potential destruction. The maximum output current is approximately 20 mA, independent of the magnitude of V_{CC}^+
- This input current only exists when the voltage at any of the input leads is driven negative. It is due to the collector-base junction of the input PNP transistor becoming forward biased and thereby acting as input diode clamps. In addition to this diode action, there is also NPN parasitic action on the IC chip. This transistor action can cause the output voltages of the op-amps to go to the V_{CC} voltage level (or to ground for a large overdrive) for the time during which an input is driven negative. This is not destructive and normal output is restored for input voltages higher than -0.3 V.
- $R_{thja/c}$ are typical values.
- Human body model: a 100 pF capacitor is charged to the specified voltage, then discharged through a 1.5kΩ resistor between two pins of the device. This is done for all couples of connected pin combinations while the other pins are floating.
- Machine model: a 200 pF capacitor is charged to the specified voltage, then discharged directly between two pins of the device with no external series resistor (internal resistor < 5Ω). This is done for all couples of connected pin combinations while the other pins are floating.
- Charged device model: all pins and the package are charged together to the specified voltage and then discharged directly to the ground through only one pin. This is done for all pins.

Table 2. Operating conditions

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage	3 to 30	V
V_{icm}	Common mode input voltage range $T_{min} \leq T_{amb} \leq T_{max}$	V_{CC}^- to V_{CC}^+ - 1.5 V_{CC}^- to V_{CC}^+ - 2	V
T_{oper}	Operating free-air temperature range	-40 to +125	°C

		$V_{id} = -1\text{V}$, $V_{CC^+} = +15 \text{ V}$, $V_o = +0.2\text{V}$	12	50		
V_{OH}	High level output voltage	$V_{CC^+} = 30 \text{ V}$, $R_L = 2\text{k}\Omega$ $T_{amb} = +25^\circ\text{C}$ $T_{min} \leq T_{amb} \leq T_{max}$	26	27		V
		$V_{CC^+} = 30 \text{ V}$, $R_L = 10\text{k}\Omega$ $T_{amb} = +25^\circ\text{C}$, $T_{min} \leq T_{amb} \leq T_{max}$	27	28		
		$V_{CC^+} = 5 \text{ V}$, $R_L = 2\text{k}\Omega$ $T_{amb} = +25^\circ\text{C}$ $T_{min} \leq T_{amb} \leq T_{max}$	3.5	3		

Table 3. $V_{CC^+} = 5\text{ V}$, $V_{CC^-} = \text{Ground}$, $V_O = 1.4\text{ V}$, $T_{amb} = 25^\circ\text{ C}$
(unless otherwise stated) (continued)

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V_{OL}	Low level output voltage	$R_L = 10\text{k}\Omega$, $T_{amb} = +25^\circ\text{C}$		5	20	mV
		$R_L = 10\text{k}\Omega$, $T_{min} \leq T_{amb} \leq T_{max}$			20	
SR	Slew rate	$V_{CC^+} = 15\text{V}$, $V_{in} = 0.5$ to 3V , $R_L = 2\text{k}\Omega$, $C_L = 100\text{pF}$, unity gain $T_{min} < T_{op} < T_{max}$	0.24 0.14	0.4		V/ μs
GBP	Gain bandwidth product	$V_{CC^+} = 30\text{V}$, $V_{in} = 10\text{mV}$, $R_L = 2\text{k}\Omega$, $C_L = 100\text{pF}$		1.3		MHz
THD	Total harmonic distortion	$f = 1\text{kHz}$, $A_V = 20\text{dB}$, $R_L = 2\text{k}\Omega$, $V_o = 2V_{pp}$, $C_L = 100\text{pF}$, $V_{CC^+} = 30\text{V}$		0.015		%
e_n	Equivalent input noise voltage	$f = 1\text{kHz}$, $R_S = 100\Omega$, $V_{CC^+} = 30\text{V}$		40		nV/ $\sqrt{\text{Hz}}$
V_{O1}/V_{O2}	Channel separation ⁽³⁾	$1\text{kHz} \leq f \leq 20\text{kHz}$		120		dB

1. $V_O = 1.4\text{ V}$, $R_S = 0\ \Omega$, $5\text{ V} < V_{CC^+} < 30\text{ V}$, $0\text{ V} < V_{ic} < V_{CC^+} - 1.5\text{ V}$.
2. The direction of the input current is out of the IC. This current is essentially constant, independent of the state of the output, so there is no change in the load on the input lines.
3. Due to the proximity of external components ensure that stray capacitance does not cause coupling between these external parts. This typically can be detected as this type of capacitance increases at higher frequencies.

5 Macromodel

5.1 Important note concerning this macromodel

Note the following remarks before using this macromodel.

- All models are a trade-off between accuracy and complexity (that is, simulation time).
- Macromodels are not a substitute to breadboarding; rather, they confirm the validity of a design approach and help to select surrounding component values.
- A macromodel emulates the **nominal** performance of a **typical** device within **specified operating conditions** (temperature, supply voltage, for example). Thus the macromodel is often not as exhaustive as the datasheet, its purpose is to illustrate the main parameters of the product.

Data derived from macromodels used outside of the specified conditions (V_{CC} , temperature, for example) or even worse, outside of the device operating conditions (V_{CC} , V_{icm} , for example), is not reliable in any way.

5.2 Macromodel code

```
** Standard Linear Ics Macromodels, 1993.
** ESD diodes added to the initial macromodel (2007).

6 Package information

In order to meet environmental requirements, STMicroelectronics offers these devices in ECOPACK® packages. These packages have a lead-free second level interconnect. The category of second level interconnect is marked on the package and on the inner box label, in compliance with JEDEC Standard JESD97. The maximum ratings related to soldering conditions are also marked on the inner box label. ECOPACK is an STMicroelectronics trademark. ECOPACK specifications are available at: www.st.com.

8 Revision history

Table 8. Document revision history

Date	Revision	Changes
01-Sep-2003	1	Initial release.
01-Nov-2005	2	Table data reformatted for easier use in <i>Electrical characteristics on page 4</i> . Minor grammatical and formatting changes throughout.
01-Jan-2006	3	LM2902WYPT PPAP reference inserted in order codes table, see <i>Section 7 on page 16</i> .
01-May-2006	4	Minimum value of slew rate at 25°C and on full temperature range added in <i>Table 3 on page 4</i> .
20-Jul-2007	5	Corrected document title to "quad operational amplifier". Corrected ESD value for HBM to 800V. Corrected thermal resistance junction to ambient values in <i>Table 1: Absolute maximum ratings</i> . Updated electrical characteristics curves. Added <i>Section 5: Macromodel</i> . Added automotive grade order codes in <i>Section 7 on page 16</i> .
15-Jan-2008	6	Corrected footnotes for automotive grade order codes.
17-Oct-2008	7	Added enhanced Vio version: LM2902AW. Corrected V_{OH} min parameter at $V_{cc}=5V$ in <i>Table 3 on page 4</i> .
