## FEATURES

## High speed

-3 dB bandwidth: 190 MHz G = +5
Slew rate: $\mathbf{8 2 0} \mathbf{V} / \mu \mathrm{s}$, RLoAd $=50 \Omega$

## Wide output swing

20.4 V p-p differential, R LoAD of $100 \Omega$ from 12 V supply

High output current
Low distortion
-95 dBc typical at $1 \mathrm{MHz}, \mathrm{V}_{\text {out }}=\mathbf{2} \mathrm{V}$ p-p, $G=+5, \operatorname{RLOAD}=50 \Omega$
-69 dBc typical at $10 \mathrm{MHz}, \mathrm{V}_{\text {out }}=2 \mathrm{~V}$ p-p, $\mathrm{G}=+5, \mathrm{R}_{\text {LOAD }}=50 \Omega$

## Power management and shutdown

Control inputs CMOS level compatible
Shutdown quiescent current $0.65 \mathrm{~mA} / \mathrm{amplifier}$
Adjustable low quiescent current: 3.9 mA to 7.6 mA per amp

## APPLICATIONS

Home networking line drivers
Twisted pair line drivers
Power line communications
Video line drivers
ARB line drivers
I/Q channel amplifiers

## GENERAL DESCRIPTION

The ADA4310-1 is comprised of two high speed, current feedback operational amplifiers. The high output current, high bandwidth, and fast slew rate make it an excellent choice for broadband applications requiring high linearity performance while driving low impedance loads.

The ADA4310-1 incorporates a power management function that provides shutdown capabilities and/or the ability to optimize the amplifiers quiescent current. The CMOScompatible, power-down control pins (PD1 and PD0) enable the ADA4310-1 to operate in four different modes: full power, medium power, low power, and complete power down. In the power-down mode, quiescent current drops to only $0.65 \mathrm{~mA} /$ amplifier, while the amplifier output goes to a high impedance state.

## PIN CONFIGURATIONS

Figure 1. Thermally Enhanced, 10-Lead MINI_SO_EP

Figure 2. Thermally Enhanced, $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ 16-Lead LFCSP_VQ

The ADA4310-1 is available in a thermally enhanced, 10-lead MSOP with an exposed paddle for improved thermal conduction and in a thermally enhanced, $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ 16-lead LFCSP. The ADA4310-1 is rated to work in the extended industrial temperature range of $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## ABSOLUTE MAXIMUM RATINGS

Table 2.

| Parameter | Rating |
| :--- | :--- |
| Supply Voltage |  |
| $\quad$ 10-Lead MINI_SO_EP | 12 V |
| $\quad$ 16-Lead LFCSP_VQ | $\pm 6 \mathrm{~V}$ |
| Power Dissipation | $\left(\mathrm{T}_{\mathrm{Jmax}}-\mathrm{T}_{\mathrm{A}}\right) / \theta_{\mathrm{JA}}$ |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Lead Temperature (Soldering 10 sec ) | $300^{\circ} \mathrm{C}$ |
| Junction Temperature | $150^{\circ} \mathrm{C}$ |

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

$\theta_{\mathrm{JA}}$ is specified for the worst-case conditions, that is, $\theta_{\mathrm{JA}}$ is specified for device soldered in circuit board for surface-mount packages.
Table 3.

| Package Type | $\boldsymbol{\theta}_{\mathrm{JA}}$ | Unit |
| :--- | :--- | :--- |
| 10-Lead MINI_SO_EP | 44 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| 16-Lead LFCSP_VQ | 63 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |

## Maximum Power Dissipation

The maximum safe power dissipation for the ADA4310-1 is limited by the associated rise in junction temperature ( $\mathrm{T}_{\mathrm{J}}$ ) on the die. At approximately $150^{\circ} \mathrm{C}$, which is the glass transition temperature, the plastic changes its properties. Even temporarily exceeding this temperature limit can change the stresses that the package exerts on the die, permanently shifting the parametric performance of the amplifiers. Exceeding a junction temperature of $150^{\circ} \mathrm{C}$ for an extended period can result in changes in silicon devices, potentially causing degradation or loss of functionality.

Figure 4 shows the maximum safe power dissipation in the package vs. the ambient temperature for the 10-lead MINI_SO_EP $\left(44^{\circ} \mathrm{C} / \mathrm{W}\right)$ and for the 16-lead LFCSP_VQ $\left(63^{\circ} \mathrm{C} / \mathrm{W}\right)$ on a JEDEC standard 4-layer board. $\theta_{\mathrm{JA}}$ values are approximations.

Figure 4. Maximum Power Dissipation vs. Temperature for a 4-Layer Board

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## ADA4310-1

## THEORY OF OPERATION

The ADA4310-1 is a current feedback amplifier with high output current capability. With a current feedback amplifier, the current into the inverting input is the feedback signal, and the open-loop behavior is that of a transimpedance, $\mathrm{dV}_{\mathrm{o}} / \mathrm{dI}_{\text {IN }}$ or $\mathrm{T}_{\mathrm{z}}$.

The open-loop transimpedance is analogous to the open-loop voltage gain of a voltage feedback amplifier. Figure 20 shows a simplified model of a current feedback amplifier. Because $\mathrm{R}_{\mathrm{IN}}$ is proportional to $1 / g_{m}$, the equivalent voltage gain is just $T_{Z} \times g_{m}$, where $\mathrm{g}_{\mathrm{m}}$ is the transconductance of the input stage. Basic analysis of the follower with gain circuit yields

$$
\frac{V_{O}}{V_{I N}}=G \times \frac{T_{Z}(s)}{T_{Z}(s)+G \times R_{I N}+R_{F}}
$$

where:
$G=1+\frac{R_{F}}{R_{G}}$
$R_{I N}=\frac{1}{g_{m}} \approx 50 \Omega$

Because $\mathrm{G} \times \mathrm{R}_{\mathrm{IN}} \ll \mathrm{R}_{\mathrm{F}}$ for low gains, a current feedback amplifier has relatively constant bandwidth vs. gain, the 3 dB point being set when $\left|T_{z}\right|=R_{F}$.

Of course, for a real amplifier there are additional poles that contribute excess phase, and there is a value for $\mathrm{R}_{\mathrm{F}}$ below which the amplifier is unstable. Tolerance for peaking and desired flatness determines the optimum $\mathrm{R}_{\mathrm{F}}$ in each application.

Figure 20. Simplified Block Diagram

## APPLICATION INFORMATION

## FEEDBACK RESISTOR SELECTION

The feedback resistor has a direct impact on the closed-loop bandwidth and stability of the current feedback op amp. Reducing the resistance below the recommended value can make the amplifier response peak and even become unstable. Increasing the size of the feedback resistor beyond the recommended value reduces the closed-loop bandwidth. Table 6 provides a convenient reference for quickly determining the feedback and gain resistor values, and the corresponding bandwidth, for common gain configurations. The recommended value of feedback resistor for the ADA4310-1 is $499 \Omega$.

Table 6. Recommended Values and Frequency Performance ${ }^{1}$

| Gain | $\mathbf{R F}_{\mathbf{F}}(\boldsymbol{\Omega})$ | $\mathbf{R}_{\mathbf{G}}(\mathbf{\Omega})$ | $\mathbf{- 3} \mathbf{~ d B ~ S S ~ B W}(\mathbf{M H z})$ |
| :--- | :--- | :--- | :--- |
| +2 | 499 | 499 | 230 |
| +5 | 499 | 124 | 190 |
| +5 | 1 k | 249 | 125 |
| +10 | 499 | 55.4 | 160 |
| +20 | 499 | 26.1 | 115 |

${ }^{1}$ Conditions: $\mathrm{V}_{\mathrm{S}}= \pm 6 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}, \mathrm{RL}=50 \Omega, \mathrm{PD} 1, \mathrm{PDO}=0,0$.

## POWER CONTROL MODES OF OPERATION

The ADA4310-1 features four power modes: full power, $3 / 4$ power, $1 / 2$ power, and shutdown. The power modes are controlled by two logic pins, PD0 and PD1. The power-down control pins are compatible with standard 3 V and 5 V CMOS logic. Table 7 shows the various power modes and associated logic states. In the power-down mode, the output of the amplifier goes into a high-impedance state.
Table 7. Power Modes

| PD1 | PD0 | Power Mode | Total Supply <br> Current (mA) | Output <br> Impedance |
| :--- | :--- | :--- | :--- | :--- |
| Low | Low | Full Power | 15.2 | Low |
| Low | High | $3 / 4$ Power | 11.2 | Low |
| High | Low | $1 / 2$ Power | 7.8 | Low |
| High | High | Power Down | 1.3 | High |

## EXPOSED THERMAL PAD CONNECTIONS

The exposed thermal pad on the 10 -lead MSOP package is both the reference for the PD pins and the only electrical connection for the negative supply voltage. Therefore, in the 10 -lead MSOP package, the ADA4310-1 can only be used on a single supply. The exposed thermal pad MUST be connected to ground. Failure to do so will render the part inoperable.

The $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ 16-lead LFCSP package has dedicated pins for both the positive and negative supplies, and it can be used in either single supply or dual supply applications. There is no electrical connection for the exposed thermal pad. Although the pad could theoretically be connected to any potential, it is still typically connected to ground.

A requirement for both packages is that the thermal pad be connected to a solid plane with low thermal resistance, ensuring adequate heat transfer away from the die and into the board.

## POWER LINE APPLICATION

Applications (that is, powerline AV modems) requiring greater than 10 dBm peak power should consider using an external line driver, such as the ADA4310-1. Figure 21 shows an example interface between the TxDAC ${ }^{\circledR}$ output and ADA4310-1 biased for single-supply operation. The TxDAC's peak-to-peak differential output voltage swing should be limited to 2 V p-p, with the ADA4310-1's gain configured to realize the additional voltage gain required by the application. A low-pass filter should be considered to filter the DAC images inherent in the signal reconstruction process. In addition, dc blocking capacitors are required to level-shift the TxDAC's output signal to the common-mode level of the ADA4310-1 (that is, AVDD/2).

Figure 21. TxDAC Output Directly via Center-Tap Transformer

## ADA4310-1

## BOARD LAYOUT

As is the case with all high speed applications, careful attention to printed circuit board layout details prevents associated board parasitics from becoming problematic. Proper RF design technique is mandatory. The PCB should have a ground plane covering all unused portions of the component side of the board to provide a low impedance return path. Removing the ground plane on all layers from the area near the input and output pins reduces stray capacitance, particularly in the area of the inverting inputs. Signal lines connecting the feedback and gain resistors should be as short as possible to minimize the inductance and stray capacitance associated with these traces. Termination resistors and loads should be located as close as possible to their respective inputs and outputs. Input and output traces should be kept as far apart as possible to minimize coupling (crosstalk) though the board. Wherever there are complementary signals, a symmetrical layout should be provided to the extent possible to maximize balanced performance. When running differential signals over a long distance, the traces on the PCB should be close. This reduces the radiated energy and makes the circuit less susceptible to RF interference. Adherence to stripline design techniques for long signal traces (greater than about 1 inch ) is recommended.

For more information on high speed board layout, go to www.analog.com and A Practical Guide to High-Speed Printed-Circuit-Board Layout.

## POWER SUPPLY BYPASSING

The ADA4310-1 operates on supplies, from +5 V to $\pm 6 \mathrm{~V}$. The ADA4310-1 circuit should be powered with a well-regulated power supply. Careful attention must be paid to decoupling the power supply. High quality capacitors with low equivalent series resistance (ESR), such as multilayer ceramic capacitors (MLCCs), should be used to minimize supply voltage ripple and power dissipation. In addition, $0.1 \mu \mathrm{~F}$ MLCC decoupling capacitors should be located no more than $1 / 8$-inch away from each of the power supply pins. A large, usually tantalum, $10 \mu \mathrm{~F}$ capacitor is required to provide good decoupling for lower frequency signals and to supply current for fast, large signal changes at the ADA4310-1 outputs. Bypassing capacitors should be laid out in such a manner to keep return currents away from the inputs of the amplifiers. This minimizes any voltage drops that can develop due to ground currents flowing through the ground plane. A large ground plane also provides a low impedance path for the return currents.
