

16 V Rail-to-Rail Buffer Amplifiers

AD8568/AD8569/AD8570

PIN CONFIGURATIONS

FEATURES

Single-Supply Operation: 4.5 V to 16 V Input Capability Beyond the Rails Rail-to-Rail Output Swing Continuous Output Current: 35 mA Peak Output Current: 250 mA Offset Voltage: 10 mV Max Slew Rate: 6 V/μs Stable with 1 μF Loads Supply Current

APPLICATIONS LCD Reference Drivers Portable Electronics Communications Equipment

GENERAL DESCRIPTION

The AD8568, AD8569, and AD8570 are low-cost, single-supply buffer amplifiers with rail-to-rail input and output capability. They are optimized for LCD monitor applications and built on an advanced high voltage CBCMOS process. The AD8568 includes two buffers, the AD8569 includes four buffers, and the AD8570 includes eight buffers.

These LCD buffers have high slew rates, 35 mA continuous output drive, and high capacitive load drive capability. They have a wide supply range and offset voltages below 10 mV.

The AD8568, AD8569, and AD8570 are specified over the -40° C to $+85^{\circ}$ C temperature range. They are available on tape and reel, with the AD8568 packaged in a 6-lead SOT-23, the AD8569 in a 10-lead MSOP, and the AD8570 in a 32-lead LFCSP and 20-lead TSSOP.

NOTES

 ${}^{1}\theta_{JA}$ is specified for worst-case conditions, i.e., θ_{JA} is specified for a device soldered onto a circuit board for surface-mount packages.

 $^2\Psi_{JB}$ is applied for calculating the junction temperature by reference to the board temperature.

Lead Temperature Range (Soldering, 60 sec)
*Stresses above those listed under Absolute Maximum Ratings may cause perma- nent damage to the device. This is a stress rating only: functional operation of the
device at these or any other conditions above those listed in the operational
sections of this specification is not implied. Exposure to absolute maximum rating

conditions for extended periods may affect device reliability.

ORDERING GUIDE

*Z = Pb-free part.

CAUTION -

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although the AD8568/AD8569/AD8570 features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

APPLICATIONS

Theory of Operation

This family of buffers is designed to drive large capacitive loads in LCD applications. Each has high output current drive and rail-to-rail input/output operation and can be powered from a single 16 V supply. They are also intended for other applications where low distortion and high output current drive are needed.

Input Overvoltage Protection

As with any semiconductor device, whenever the input exceeds either supply voltage, attention needs to be paid to the input overvoltage characteristics. As an overvoltage occurs, the amplifier could be damaged, depending on the voltage level and the magnitude of the fault current. When the input voltage exceeds either supply by more than 0.6 V, the internal pn junctions will allow current to flow from the input to the supplies.

This input current is not inherently damaging to the device as long as it is limited to 5 mA or less. If a condition exists using the buffers where the input exceeds the supply by more than 0.6 V, an external series resistor should be added. The size of the resistor can be calculated by using the maximum overvoltage divided by 5 mA. This resistance should be placed in series with the input exposed to an overvoltage.

Output Phase Reversal

The buffer family is immune to phase reversal. Although the device's output will not change phase, large currents due to input overvoltage could damage the device. In applications where the possibility exists of an input voltage exceeding the supply voltage, overvoltage protection should be used as described in the previous section.

Power Dissipation

The maximum allowable internal junction temperature of 150° C limits the device's maximum power dissipation. As the ambient temperature increases, the maximum power dissipated by the device must decrease linearly to maintain the maximum junction temperature. If this maximum junction temperature is exceeded momentarily, the device will still operate properly once the junction temperature is reduced below 150° C. If the maximum junction temperature is exceeded for an extended period of time, overheating could lead to permanent damage of the device.

The maximum safe junction temperature, T_{JMAX} , is 150°C. Using the following formula, we can obtain the maximum power that the buffer family can safely dissipate as a function of temperature.

$$P_{DISS} = \left(T_{JMAX} - T_A\right) / \theta_{JA}$$

where:

 P_{DISS} = the power dissipation.

- T_{JMAX} = the maximum allowable junction temperature (150°C).
- T_A = the ambient temperature of the circuit.
- θ_{JA} = the AD856x package thermal resistance, junction-to-ambient.

Junction-to-amolent.

The power dissipated by the device can be calculated as

$$P_{DISS} = (V_S - V_{OUT}) \times I_{LOAD}$$

where:

 V_S = the supply voltage. V_{OUT} = the output voltage. I_{LOAD} = the output load current.

Downloaded from Elcodis.com electronic components distributor

Figure 1 shows the maximum power dissipation versus temperature. To achieve proper operation, use the previous equation to calculate P_{DISS} for a specific package at any given temperature, or see Figure 1.

Figure 1. Maximum Power Dissipation vs. Temperature for 6- and 10-Lead Packages

Total Harmonic Distortion + Noise (THD+N)

The buffer family features low THD+N. The total harmonic distortion plus noise for the buffer over the entire supply range is below 0.08%. When the device is powered from a 16 V supply, the THD+N stays below 0.03%. Figure 2 shows the AD8568 THD+N versus frequency performance.

Figure 2. AD8568 THD+N vs. Frequency

Short-Circuit Output Conditions

The buffer family does not have internal short-circuit protection circuitry. As a precautionary measure, do not short the output directly to the positive power supply or to ground.

It is not recommended to operate the AD856x with more than 35 mA of continuous output current. The output current can be limited by placing a series resistor at the output of the amplifier whose value can be derived using the following equation.

$$R_X \ge \frac{V_S}{35 \, mA}$$

For a 5 V single-supply operation, R_X should have a minimum value of 143 Ω .
