

# CLC451

## Single Supply, Low-Power, High Output, Programmable Buffer

### General Description

The CLC451 is a low cost, high speed (85MHz) buffer that features user-programmable gains of +2, +1, and -1V/V. It has a new output stage that delivers high output drive current (100mA), but consumes minimal quiescent supply current (1.5mA) from a single 5V supply. Its current feedback architecture, fabricated in an advanced complementary bipolar process, maintains consistent performance over a programmable range of gains and wide signal levels, and has a linear-phase response up to one half of the -3dB frequency. The CLC451's internal feedback network provides an excellent gain accuracy of 0.3%

The CLC451 offers superior dynamic performance with a 85MHz small-signal bandwidth, 260V/ $\mu$ s slew rate and 6.5ns rise/fall times ( $2V_{step}$ ). The combination of the small SOT23-5 package, low quiescent power, high output current drive, and high-speed performance make the CLC451 well suited for many battery-powered personal communication/computing systems.

The ability to drive low-impedance, highly capacitive loads, makes the CLC451 ideal for single ended cable applications. It also drives low impedance loads with minimum distortion. The CLC451 will drive a 100 $\Omega$  load with only -78/-65dBc second/third harmonic distortion ( $A_v = +2$ ,  $V_{out} = 2V_{pp}$ ,  $f = 1MHz$ ). With a 25 $\Omega$  load, and the same conditions, it produces only -55/-60dBc second/third harmonic distortion. It is also optimized for driving high currents into single-ended transformers and coils.

When driving the input of high-resolution A/D converters, the CLC451 provides excellent -66/-75dBc second/third harmonic distortion ( $A_v = +2$ ,  $V_{out} = 2V_{pp}$ ,  $f = 1MHz$ ,  $R_L = 1k\Omega$ ) and fast settling time.

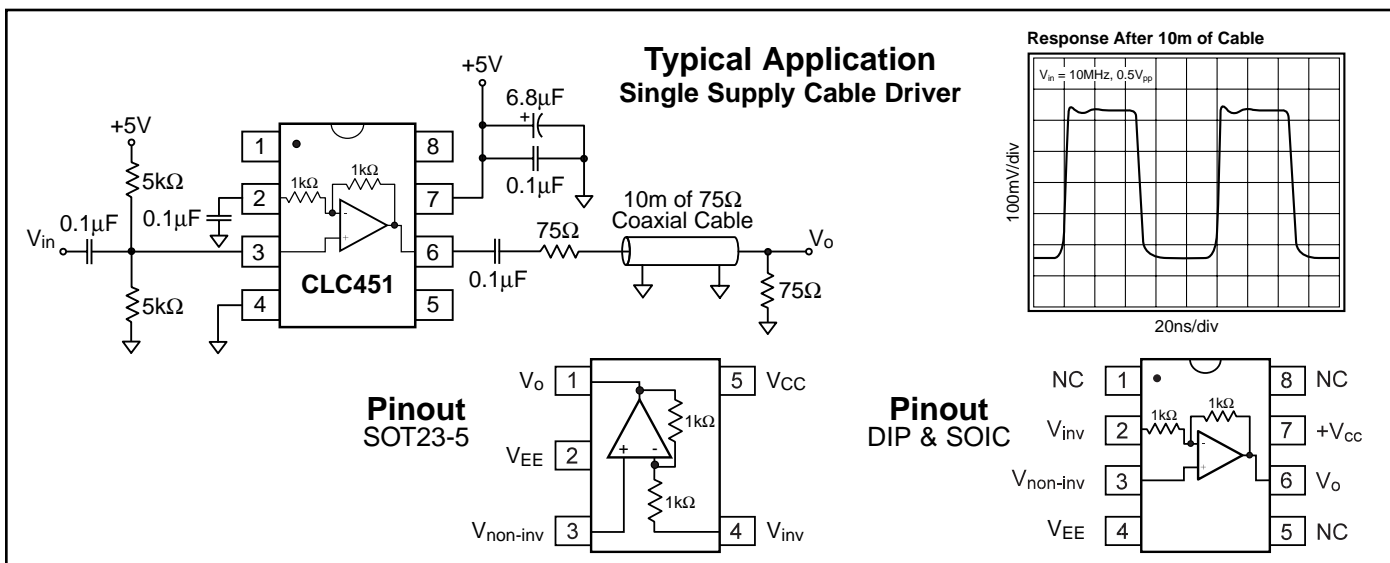

### Features

- 100mA output current
- 1.5mA supply current
- 85MHz bandwidth ( $A_v = +2$ )
- -66/-75dBc HD2/HD3 (1MHz)
- 25ns settling to 0.05%
- 260V/ $\mu$ s slew rate
- Stable for capacitive loads up to 1000pF
- Single 5V to  $\pm 5V$  supplies
- Available in Tiny SOT23-5 package

### Applications

- Coaxial cable driver
- Twisted pair driver
- Transformer/Coil Driver
- High capacitive load driver
- Video line driver
- Portable/battery-powered applications
- A/D driver

Maximum Output Voltage vs.  $R_L$

## +5V Electrical Characteristics ( $A_v = +2$ , $R_L = 100\Omega$ , $V_s = +5V^1$ , $V_{cm} = V_{EE} + (V_s/2)$ , $R_L$ tied to $V_{cm}$ , unless specified)

## CLC451 Operation

The CLC451 is a current feedback buffer built in an advanced complementary bipolar process. The CLC451 operates from a single 5V supply or dual  $\pm 5V$  supplies. Operating from a single 5V supply, the CLC451 has the following features:

- Gains of +1, -1, and 2V/V are achievable without external resistors
- Provides 100mA of output current while consuming only 7.5mW of power
- Offers low -66/-75dBc 2nd and 3rd harmonic distortion
- Provides BW > 60MHz and 1MHz distortion < -55dBc at  $V_o = 2V_{pp}$

The CLC451 performance is further enhanced in  $\pm 5V$  supply applications as indicated in the  **$\pm 5V$  Electrical Characteristics** table and  **$\pm 5V$  Typical Performance** plots.

If gains other than +1, -1, or +2V/V are required, then the CLC450 can be used. The CLC450 is a current feedback amplifier with near identical performance and allows for external feedback and gain setting resistors.

### Current Feedback Amplifiers

Some of the key features of current feedback technology are:

- Independence of AC bandwidth and voltage gain
- Inherently stable at unity gain
- Adjustable frequency response with feedback resistor
- High slew rate
- Fast settling

Current feedback operation can be described using a simple equation. The voltage gain for a non-inverting or inverting current feedback amplifier is approximated by Equation 1.

$$\frac{V_o}{V_{in}} = \frac{A_v}{1 + \frac{R_f}{Z(j\omega)}} \quad \text{Equation 1}$$

where:

- $A_v$  is the closed loop DC voltage gain
- $R_f$  is the feedback resistor
- $Z(j\omega)$  is the CLC451's open loop transimpedance gain
- $\frac{Z(j\omega)}{R_f}$  is the loop gain

The denominator of Equation 1 is approximately equal to 1 at low frequencies. Near the -3dB corner frequency, the interaction between  $R_f$  and  $Z(j\omega)$  dominates the circuit performance. The value of the feedback resistor has a large affect on the circuits performance. Increasing  $R_f$  has the following affects:

- Decreases loop gain
- Decreases bandwidth
- Reduces gain peaking
- Lowers pulse response overshoot
- Affects frequency response phase linearity

## CLC451 Design Information

### Closed Loop Gain Selection

The CLC451 is a current feedback op amp with  $R_f = R_g = 1k\Omega$  on chip (in the package). Select from three closed loop gains without using any external gain or feedback resistors. Implement gains of +2, +1, and -1V/V by connecting pins 2 and 3 as described in the chart below.

Gain $A_v$	Input Connections	
	Non-Inverting (pin3)	Inverting (pin2)
-1V/V	ground	input signal
+1V/V	input signal	NC (open)
+2V/V	input signal	ground

The gain accuracy of the CLC451 is excellent and stable over temperature change. The internal gain setting resistors,  $R_f$  and  $R_g$  are diffused silicon resistors with a process variation of  $\pm 20\%$  and a temperature coefficient of  $\sim 2000\text{ppm}/^\circ\text{C}$ . Although their absolute values change with processing and temperature, their ratio ( $R_f/R_g$ ) remains constant. If an external resistor is used in series with  $R_g$ , gain accuracy over temperature will suffer.

### Single Supply Operation ( $V_{CC} = +5V, V_{EE} = \text{GND}$ )

The specifications given in the  **$\pm 5V$  Electrical Characteristics** table for single supply operation are measured with a common mode voltage ( $V_{cm}$ ) of 2.5V.  $V_{cm}$  is the voltage around which the inputs are applied and the output voltages are specified.

Operating from a single +5V supply, the Common Mode Input Range (CMIR) of the CLC451 is typically +0.8V to +4.2V. The typical output range with  $R_L=100\Omega$  is +1.0V to +4.0V.

For single supply DC coupled operation, keep input signal levels above 0.8V DC. For input signals that drop below 0.8V DC, AC coupling and level shifting the signal are recommended. The non-inverting and inverting configurations for both input conditions are illustrated in the following 2 sections.

### DC Coupled Single Supply Operation

Figures 1, 2, and 3 on the following page, show the recommended configurations for input signals that remain above 0.8V DC.

Note:  $R_b$  provides DC bias for the non-inverting input.  $R_b$ ,  $R_L$  and  $R_t$  are tied to  $V_{cm}$  for minimum power consumption and maximum output swing.

Select  $R_t$  to yield desired  $R_{in} = R_t || R_g$ , where  $R_g = 1k\Omega$ .

Figure 1: DC Coupled,  $A_v = -1V/V$  Configuration

Note:  $R_t$  and  $R_L$  are tied to  $V_{cm}$  for minimum power consumption and maximum output swing.

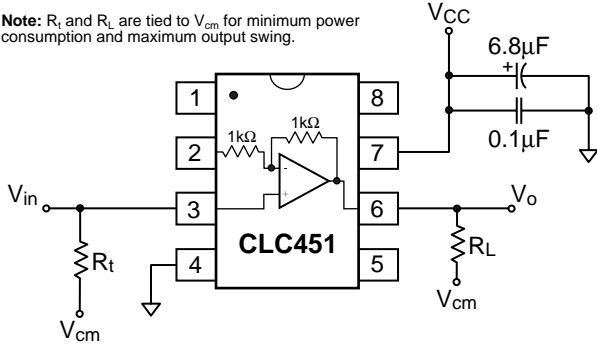

Figure 2: DC Coupled,  $A_v = +1V/V$  Configuration

Note:  $R_t$ ,  $R_L$  and  $R_g$  are tied to  $V_{cm}$  for minimum power consumption and maximum output swing.

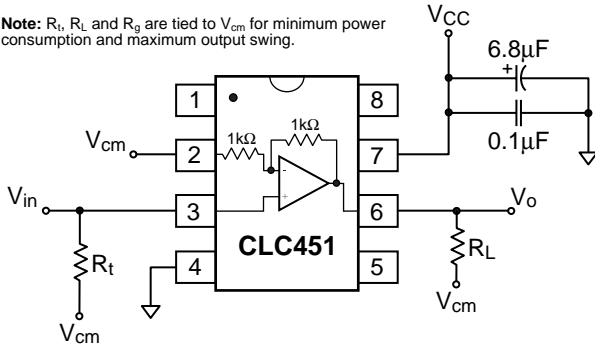

Figure 3: DC Coupled,  $A_v = +2V/V$  Configuration

### AC Coupled Single Supply Operation

Figures 4, 5, and 6 show possible non-inverting and inverting configurations for input signals that go below 0.8V DC.

$$V_o = -V_{in} + 2.5$$

$$\text{Low frequency cutoff} = \frac{1}{2\pi R_g C_c}$$

where  $R_g = 1k\Omega$ .

Figure 4: AC Coupled,  $A_v = -1V/V$  Configuration

The input is AC coupled to prevent the need for level shifting the input signal at the source. The resistive voltage divider biases the non-inverting input to  $V_{CC} \div 2 = 2.5V$  (For  $V_{CC} = +5V$ ).

$$V_o = V_{in} + 2.5$$

$$\text{Low frequency cutoff} = \frac{1}{2\pi R_{in} C_c}$$

where  $R_{in} = \frac{R}{2}$   $R \gg R_{source}$

Figure 5: AC Coupled,  $A_v = +1V/V$  Configuration

$$V_o = 2V_{in} + 2.5$$

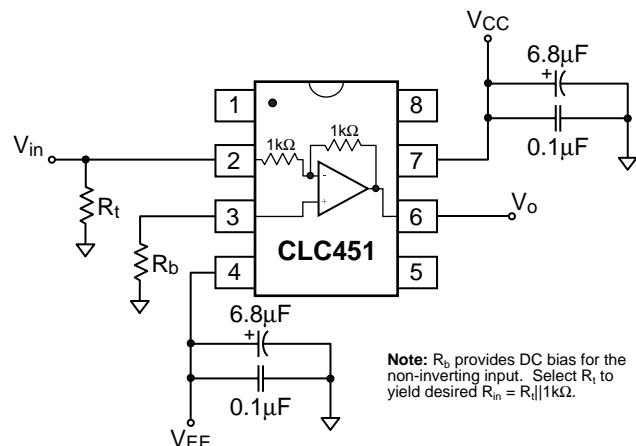

$$\text{Low frequency cutoff} = \frac{1}{2\pi R_{in} C_c}$$

where  $R_{in} = \frac{R}{2}$   $R \gg R_{source}$

Figure 6: AC Coupled,  $A_v = +2V/V$  Configuration

### Dual Supply Operation

The CLC451 operates on dual supplies as well as single supplies. The non-inverting and inverting configurations are shown in Figures 7, 8 and 9.

Note:  $R_b$  provides DC bias for the non-inverting input. Select  $R_t$  to yield desired  $R_{in} = R_t || 1k\Omega$ .

Figure 7: Dual Supply,  $A_v = -1V/V$  Configuration

Figure 8: Dual Supply,  $A_v = +1V/V$  Configuration

Figure 9: Dual Supply,  $A_v = +2V/V$  Configuration

### Bandwidth vs. Output Amplitude

The bandwidth of the CLC451 is at a maximum for output voltages near  $1V_{pp}$ . The bandwidth decreases for smaller and larger output amplitudes. Refer to the **Frequency Response vs.  $V_o$**  plots.

### Load Termination

The CLC451 can source and sink near equal amounts of current. For optimum performance, the load should be tied to  $V_{cm}$ .

### Driving Cables and Capacitive Loads

When driving cables, double termination is used to prevent reflections. For capacitive load applications, a small series resistor at the output of the CLC451 will improve stability and settling performance. The **Frequency Response vs.  $C_L$**  and **Recommended  $R_s$  vs.  $C_L$**  plots, in the typical performance section, give the recommended series resistance value for optimum flatness at various capacitive loads.

### Transmission Line Matching

One method for matching the characteristic impedance ( $Z_0$ ) of a transmission line or cable is to place the appropriate resistor at the input or output of the amplifier.

Figure 10 shows typical inverting and non-inverting circuit configurations for matching transmission lines.

Non-inverting gain applications:

- Connect pin 2 as indicated in the table in the **Closed Loop Gain Selection** section.
- Make  $R_1$ ,  $R_2$ ,  $R_6$ , and  $R_7$  equal to  $Z_0$ .
- Use  $R_3$  to isolate the amplifier from reactive loading caused by the transmission line, or by parasitics.

Inverting gain applications:

- Connect  $R_3$  directly to ground.
- Make the resistors  $R_4$ ,  $R_6$ , and  $R_7$  equal to  $Z_0$ .
- Make  $R_5 \parallel R_g = Z_0$ .

The input and output matching resistors attenuate the signal by a factor of 2, therefore additional gain is needed. Use  $C_6$  to match the output transmission line over a greater frequency range.  $C_6$  compensates for the increase of the amplifier's output impedance with frequency.

Figure 10: Transmission Line Matching

### Power Dissipation

Follow these steps to determine the power consumption of the CLC451:

1. Calculate the quiescent (no-load) power:  

$$P_{amp} = I_{CC} (V_{CC} - V_{EE})$$
2. Calculate the RMS power at the output stage:  

$$P_o = (V_{CC} - V_{load}) (I_{load})$$
, where  $V_{load}$  and  $I_{load}$  are the RMS voltage and current across the external load.
3. Calculate the total RMS power:  

$$P_t = P_{amp} + P_o$$

The maximum power that the DIP, SOIC, and SOT packages can dissipate at a given temperature is illustrated in Figure 11. The power derating curve for any CLC451 package can be derived by utilizing the following equation:

$$\frac{(175^\circ - T_{amb})}{\theta_{JA}}$$

where

$T_{amb}$  = Ambient temperature ( $^\circ C$ )

$\theta_{JA}$  = Thermal resistance, from junction to ambient, for a given package ( $^\circ C/W$ )

Figure 11: Power Derating Curve

### Layout Considerations

A proper printed circuit layout is essential for achieving high frequency performance. Comlinear provides evaluation boards for the CLC451 (CLC730013-DIP, CLC730027-SOIC, CLC730068-SOT) and suggests their use as a guide for high frequency layout and as an aid for device testing and characterization.

General layout and supply bypassing play major roles in high frequency performance. Follow the steps below as a basis for high frequency layout:

- Include 6.8μF tantalum and 0.1μF ceramic capacitors on both supplies.
- Place the 6.8μF capacitors within 0.75 inches of the power pins.
- Place the 0.1μF capacitors less than 0.1 inches from the power pins.
- Remove the ground plane under and around the part, especially near the input and output pins to reduce parasitic capacitance.
- Minimize all trace lengths to reduce series inductances.
- Use flush-mount printed circuit board pins for prototyping, never use high profile DIP sockets.

### Evaluation Board Information

Data sheets are available for the CLC730013/CLC730027 and CLC730068 evaluation boards. The evaluation board data sheets provide:

- Evaluation board schematics
- Evaluation board layouts
- General information about the boards

The CLC730013/CLC730027 data sheet also contains tables of recommended components to evaluate several of Comlinear's high speed amplifiers. This table for the CLC451 is illustrated below. Refer to the evaluation board data sheet for schematics and further information.

### Components Needed to Evaluate the CLC451 on the Evaluation Board:

- $R_{in}$ ,  $R_{out}$  - Typically 50Ω (Refer to the **Basic Operation** section of the evaluation board data sheet for details)

- $R_t$  - Optional resistor for inverting gain configurations (Select  $R_t$  to yield desired input impedance =  $R_g \parallel R_t$ )
- $C_1$ ,  $C_2$  - 0.1μF ceramic capacitors
- $C_3$ ,  $C_4$  - 6.8μF tantalum capacitors

Components not used:

- $C_5$ ,  $C_6$ ,  $C_7$ ,  $C_8$
- $R_1$  thru  $R_8$

The evaluation boards are designed to accommodate dual supplies. The boards can be modified to provide single supply operation. For best performance; 1) do not connect the unused supply, 2) ground the unused supply pin.

### Special Evaluation Board Considerations for the CLC451

To optimize off-isolation of the CLC451, cut the  $R_t$  trace on both the CLC730013 and the CLC730027 evaluation boards. This cut minimizes capacitive feedthrough between the input and the output. Figure 12 shows where to cut both evaluation boards for improved off-isolation.

Figure 12: Evaluation Board Changes

### SPICE Models

SPICE models provide a means to evaluate amplifier designs. Free SPICE models are available for Comlinear's monolithic amplifiers that:

- Support Berkeley SPICE 2G and its many derivatives
- Reproduce typical DC, AC, Transient, and Noise performance
- Support room temperature simulations

The **readme** file that accompanies the diskette lists released models, and provides a list of modeled parameters. The application note OA-18, Simulation SPICE Models for Comlinear's Op Amps, contains schematics and a reproduction of the readme file.

## Application Circuits

### Single Supply Cable Driver

The typical application shown on the front page shows the CLC451 driving 10m of 75Ω coaxial cable. The CLC451 is set for a gain of +2V/V to compensate for the divide-by-two voltage drop at  $V_o$ .

### Twisted Pair Driver

The high output current and low distortion, of the CLC451, make it well suited for driving transformers. Figure 13 illustrates a typical twisted pair driver utilizing the CLC451 and a transformer. The transformer provides the signal and its inversion for the twisted pair.

Figure 13: Twisted Pair Driver

To match the line's characteristic impedance ( $Z_0$ ) set:

- $R_L = Z_0$
- $R_m = R_{eq}$

Where  $R_{eq}$  is the transformed value of the load impedance, ( $R_L$ ), and is approximated by:

$$R_{eq} = \frac{R_L}{n^2}$$

Select the transformer so that it loads the line with a value close to  $Z_0$ , over the desired frequency range. The output impedance,  $R_o$ , of the CLC451 varies with frequency and can also affect the return loss. The return loss, shown below, takes into account an ideal transformer and the value of  $R_o$ .

$$\text{Return Loss (dB)} \approx -20 \log_{10} \left| n^2 \cdot \frac{R_o}{Z_0} \right|$$

The load current ( $I_L$ ) and voltage ( $V_o$ ) are related to the CLC451's maximum output voltage and current by:

$$\begin{aligned} |V_o| &\leq n \cdot V_{max} \\ |I_L| &\leq \frac{I_{max}}{n} \end{aligned}$$

From the above current relationship, it is obvious that an amplifier with high output drive capability is required.

---

### Customer Design Applications Support

National Semiconductor is committed to design excellence. For sales, literature and technical support, call the National Semiconductor Customer Response Group at **1-800-272-9959** or fax **1-800-737-7018**.

#### Life Support Policy

National's products are not authorized for use as critical components in life support devices or systems without the express written approval of the president of National Semiconductor Corporation. As used herein:

1. Life support devices or systems are devices or systems which, a) are intended for surgical implant into the body, or b) support or sustain life, and whose failure to perform, when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in a significant injury to the user.
2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
