

# LD2982BXX18

Very low drop and low noise voltage regulator with inhibit function, low ESR capacitors compatible

Obsolete

#### **Features**

- Very low dropout voltage (120 mV at 50 mA and 7 mV at 1 mA load)
- Very low quiescent current (375 mA typ. at 50 mA load and 75 mA at 1 mA)
- Output current up to 50 mA
- Logic controlled electronic shutdown
- Output voltage of 1.8 V
- Internal current and thermal limit
- Available in ± 1 % tolerance (at 25 °C, A version)
- Supply voltage rejection: 45 dB (typ)
- Only 1 µF for stability
- Low output noise voltage 30 µVrms
- Smallest package SOT23-5L
- Temperature range: -40 °C to 125 °C

### **Description**

The LD2982 is a 50 mA fixed output vo tage regulator. The ultra low drop voltage and the low quiescent current make them panicularly suitable for low noise, low power applications, and in battery powered systems. In sieep mode quiescent current is less than 1 µA when INHIBIT pin is pulled low. Shutdown logic control function is available on pin 3 (TTL compatible). This means that when the device is used as local regulator, it is possible to put a part of the board in standoy, decreasing the total power consumption.

An external capacitor  $C_{BYP}$  = 10 nF connected between bypass pin and GND reduce the noise to 30  $\mu$ Vrms.

| Order code  | Output voltage |  |
|-------------|----------------|--|
| LD2982BM18R | 1.8 V          |  |

SOT23-5L

Typical application are in cellular phone, palmtop/laptop computer, personal hightal assistant (PDA), personal stelled, camcorder and camera.

LD2982BXX18 Application notes

### 6 Application notes

### 6.1 External capacitors

Like any low-dropout regulator, the LD2982 requires external capacitors for regulator stability. This capacitor must be selected to meet the requirements of minimum capacitance and equivalent series resistance. We suggest to solder input and output capacitors as close as possible to the relative pins.

#### 6.2 Input capacitor

An input capacitor whose value is 1  $\mu$ F is required with the LD2982 (amount of capacitance can be increased without limit). This capacitor must be located a distance of not more than 0.5" from the input pin of the device and returned to a clean analog ground. Any good quality ceramic, tantalum or film capacitors can be used for this capacitor.

### 6.3 Output capacitor

The LD2982 is designed specifically to work with ceramic output capacitors. It may also be possible to use tantalum capacitors, but these are not as attractive for reasons of size and cost. By the way, the output capacitor must meet both the requirement for minimum amount of capacitance and ESR (equivalent series resistance) value. Due to the different loop gain, the stability improves for higher output versions and so the suggested minimum output capacitor value, if low ESR ceramic type is used, is 1  $\mu F$  for output voltages equal or major than 3.8 V, 2.2  $\mu F$  for V $_{\rm O}$  going from 1.8 to 3.3 V, and 3.3  $\mu F$  for the other versions. However, if an output capacitor lower than the suggested one is used, it's possible to make stable the regulator adding a resistor in series to the capacitor.

# 6.4 Important

The output capacitor must maintain its ESR in the stable region over the full operating temperature to assure stability. Also, capacitor tolerance and variation with temperature must be considered to assure the minimum amount of capacitance is provided at all times. This capacitor should be located not more than 0.5" from the output pin of the device and returned to a clean analog ground.

### 6.5 Inhibit input operation

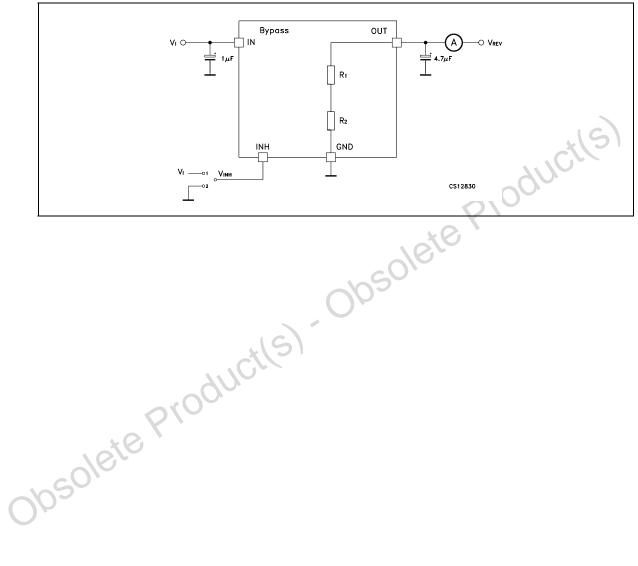

The inhibit pin can be used to turn OFF the regulator when pulled low, so drastically reducing the current consumption down to less than 1  $\mu$ A. When the inhibit feature is not used, this pin must be tied to V<sub>I</sub> to keep the regulator output ON at all times. To assure proper operation, the signal source used to drive the inhibit pin must be able to swing above and below the specified thresholds listed in the electrical characteristics section under V<sub>IH</sub> V<sub>IL</sub>. Any slew rate can be used to drive the inhibit.

Application notes LD2982BXX18

#### 6.6 Reverse current

The power transistor used in the LD2982 has not an inherent diode connected between the regulator input and output. If the output is forced above the input, no current will flow from the output to the input across the series pass transistor. When a  $V_{REV}$  voltage is applied on the output, the reverse current measured flows to the GND across the two feedback resistors. This current typical value is 160  $\mu$ A.  $R_1$  and  $R_2$  resistors are implanted type; typical values are, respectively, 42.6  $k\Omega$  and 51.150  $k\Omega$ .

# 7 Package mechanical data

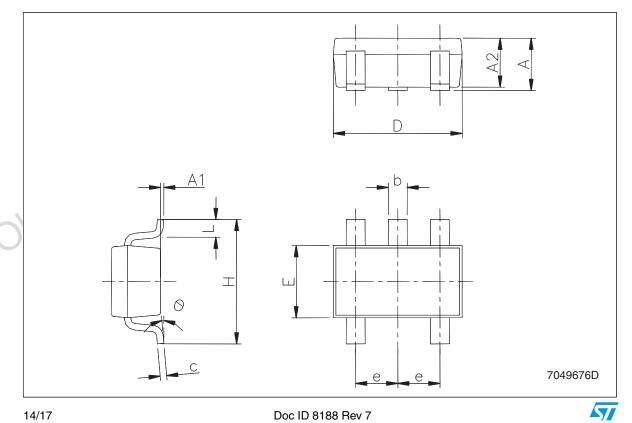

In order to meet environmental requirements, ST offers these devices in different grades of  $\mathsf{ECOPACK}^{@}$  packages, depending on their level of environmental compliance.  $\mathsf{ECOPACK}^{@}$  specifications, grade definitions and product status are available at:  $\mathit{www.st.com}$ .  $\mathsf{ECOPACK}^{@}$  is an ST trademark.
