ON Semiconductor®

# 6 and 8-Channel Low Capacitance ESD Protection Arrays

CM1213

#### **Features**

- 6 or 8 channels of ESD protection
  - Note: For 1, 2, and 4 channel devices, see the CM1213A datasheet.
- Provides ESD protection to IEC61000-4-2 Level 4
  - ±8kV contact discharge
- Low channel input capacitance of 1.0pF typical
- Minimal capacitance change with temperature and voltage
- Channel input capacitance matching of 0.02pF typical is ideal for differential signals
- Mutual capacitance between signal pin and adjacent signal pin -0.11pF typical
- Zener diode protects supply rail and eliminates the need for external by-pass capacitors
- Each I/O pin can withstand over 1000 ESD strikes\*
- Available in SOIC and MSOP, lead-free packaging

## **Applications**

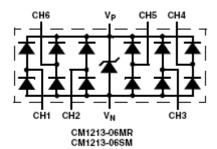

- USB2.0 ports at 480Mbps in desktop PCs, notebooks and peripherals
- IEEE1394 Firewire® ports at 400Mbps / 800Mbps
- DVI ports, HDMI ports in notebooks, set top boxes, digital TVs, LCD displays
- Serial ATA ports in desktop PCs and hard disk drives
- PCI Express ports
- General purpose high-speed data line ESD protection

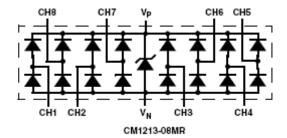

### **Product Description**

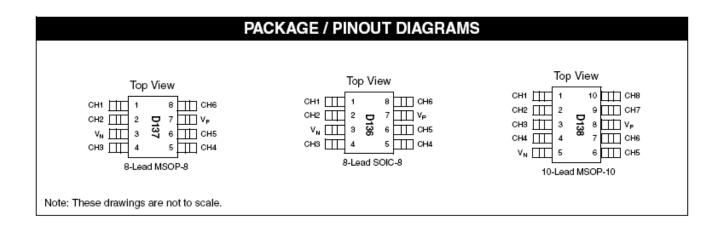

The CM1213 family of diode arrays has been designed to provide ESD protection for electronic components or sub-systems requiring minimal capacitive loading. These devices are ideal for protecting systems with high data and clock rates or for circuits requiring low capacitive loading. Each ESD channel consists of a pair of diodes in series which steer the positive or negative ESD current pulse to either the positive  $(V_{\scriptscriptstyle B})$  or negative  $(V_{\scriptscriptstyle N})$ supply rail. A Zener diode is embedded between V<sub>P</sub> and V<sub>N</sub>, offering two advantages. First, it protects the V<sub>cc</sub> rail against ESD strikes, and second, it eliminates the need for a bypass capacitor that would otherwise be needed for absorbing positive ESD strikes to ground. The CM1213 will protect against ESD pulses up to ±8kV per the IEC 61000-4-2 standard.

These devices are particularly well-suited for protecting systems using high-speed ports such as USB2.0, IEEE1394 (Firewire®, iLink<sup>TM</sup>), Serial ATA, DVI, HDMI and corresponding ports in removable storage, digital camcorders, DVD-RW drives and other applications where extremely low loading capacitance with ESD protection are required in a small package footprint.

## **Application Information**

#### **Design Considerations**

In order to realize the maximum protection against ESD pulses, care must be taken in the PCB layout to minimize parasitic series inductances on the Supply/Ground rails as well as the signal trace segment between the signal input (typically a connector) and the ESD protection device. Refer to Application of Positive ESD Pulse between Input Channel and Ground, which illustrates an example of a positive ESD pulse striking an input channel. The parasitic series inductance back to the power supply is represented by  $L_1$  and  $L_2$ . The voltage  $V_{CL}$  on the line being protected is:

$$V_{cL}$$
 = Fwd voltage drop of  $D_1$  +  $V_{SUPPLY}$  +  $L_1$  x d( $I_{ESD}$  ) / dt +  $L_2$  x d( $I_{ESD}$ ) / dt

where  $I_{ESD}$  is the ESD current pulse, and  $V_{SUPPLY}$  is the positive supply voltage.

An ESD current pulse can rise from zero to its peak value in a very short time. As an example, a level 4 contact discharge per the IEC61000-4-2 standard results in a current pulse that rises from zero to 30 Amps in 1ns. Here  $d(I_{ESD})/dt$  can be approximated by  $\Delta I_{ESD}/\Delta t$ , or  $30/(1x10^{-9})$ . So just 10nH of series inductance (L<sub>1</sub> and L<sub>2</sub> combined) will lead to a 300V increment in  $V_{Cl}$ !

Similarly for negative ESD pulses, parasitic series inductance from the  $V_N$  pin to the ground rail will lead to drastically increased negative voltage on the line being protected.

The CM1213 has an integrated Zener diode between  $V_p$  and  $V_N$ . This greatly reduces the effect of supply rail inductance  $L_z$  on  $V_{CL}$  by clamping  $V_p$  at the breakdown voltage of the Zener diode. However, for the lowest possible  $V_{CL}$ , especially when  $V_p$  is biased at a voltage significantly below the Zener breakdown voltage, it is recommended that a  $0.22\mu F$  ceramic chip capacitor be connected between  $V_p$  and the ground plane.

As a general rule, the ESD Protection Array should be located as close as possible to the point of entry of expected electrostatic discharges. The power supply bypass capacitor mentioned above should be as close to the  $V_p$  pin of the Protection Array as possible, with minimum PCB trace lengths to the power supply, ground planes and between the signal input and the ESD device to minimize stray series inductance.
