

DATA SHEET

SKY65051-377LF: 0.45-6.0 GHz Low-Noise Transistor

Applications

- Wireless infrastructure: WLAN, WiMAX, broadband, cellular base stations
- Test instrumentation
- LNA for GPS receivers
- Satellite receivers

Features

- Externally matched for wideband operation
- Noise Figure = 0.45 dB @ 2.4 GHz of device only
- Noise Figure = 0.65 dB @ 2.4 GHz including matching network loss
- Gain = 15.5 dB @ 2.4 GHz
- OIP3 = +24 dBm @ 2.4 GHz
- P1dB = +12 dBm @ 2.4 GHz
- Adjustable supply current from 5 to 55 mA
- Small, QFN (4-pin, 2 x 2 mm) Pb-free package (MSL1, 260 °C per JEDEC J-STD-020)

NEW

Skyworks Green™ products are RoHS (Restriction of Hazardous Substances)-compliant, conform to the EIA/EICTA/JEITA Joint Industry Guide (JIG) Level A guidelines, are halogen free according to IEC-61249-2-21, and contain <1,000 ppm antimony trioxide in polymeric materials.

Figure 1. SKY65051-377LF Block Diagram

Description

The SKY65051-377LF is a high performance, n-channel low-noise transistor. The device is fabricated from Skyworks advanced depletion mode pHEMT process and is provided in a 2 x 2 mm, 4-pin Quad Flat No-Lead (QFN) package.

The transistor's low Noise Figure (NF), high gain, and excellent 3rd Order Intercept Point (IP3) allow the device to be used in various receiver and transmitter applications.

A functional block diagram is shown in Figure 1. The pin configuration and package are shown in Figure 2. Signal pin assignments and functional pin descriptions are provided in Table 1.

Figure 2. SKY65051-377LF Pinout – 4-Pin QFN (Bottom View)

Table 1. SKY65051-377LF Signal Descriptions

Pin #	Name	Description	Pin #	Name	Description
1	DRAIN	RF output. Requires external matching network for optimum performance. Supply voltage required through external RF choke.	3	GATE	RF input. Requires external matching network for optimum performance.
2	SOURCE	Source lead. Provides DC self-biasing point and AC ground.	4	SOURCE	Source lead. Provides DC self-biasing point and AC ground.

Functional Description

The SKY65051-377LF is a depletion mode pHEMT designed for low noise, high frequency applications. The SKY65051-377LF has a typical NF of 0.65 dB tested at the 2.4 GHz wireless LAN frequency band. A gain of 15.5 dB typical is achieved using the same circuit. If the frequency of operation is lowered to the 1 GHz range, NF performance of the device can approach 0.5 dB including input matching network losses.

De-embedded scattering and noise parameters are provided in addition to typical circuit topologies for commonly used frequency bands. With an appropriate circuit, the SKY65051-377LF can be used for many applications from 450 MHz up to 6 GHz. The 2 x 2 mm QFN package makes the SKY65051-377LF an ideal low noise and low cost solution.

Biasing

To properly bias a depletion mode pHEMT, both the gate and drain of the device must be properly biased. At $V_{GS} = 0\text{ V}$ and $V_{DS} \geq 2\text{ V}$, the device is in a saturated state and draws the maximum amount of current, I_{DSS} . The device typically achieves the best noise performance at $V_{DS} = 3\text{ V}$ and $I_{DSS} = 15\text{ mA}$. To control I_{DS} , V_{GS} must be biased with a negative voltage supply.

To eliminate the need for a negative DC supply, self-biasing should be used when a resistor is placed between one of the source leads and ground. A bypass capacitor should be placed in parallel to this resistor to provide an RF ground and to ensure performance remains unchanged at the operating frequency.

When current flows from drain to source and through the resistor, the source voltage becomes biased above DC ground. The gate pin of the device should be left unbiased at 0 V, which creates the

desired negative V_{GS} value. This simplifies the design by eliminating the need for a second DC supply.

Table 2 provides the resistor values used to properly bias the SKY65051-377LF.

RF Matching Networks

The SKY65051-377LF Evaluation Board assembly diagram is shown in Figure 12 and a circuit schematic is provided in Figure 13. The schematic shows the recommended RF matching network used for the 2.4 GHz wireless LAN frequency band. The network was designed using de-embedded s- and n-parameters. The circuit was primarily tuned for gain, NF, and input and output return loss, while maintaining proper stability.

Optimal noise performance is attained when the impedance presented to the input of the amplifier is equal to its minimum NF impedance point. Components C1, C2, C3, L1, and L2 shown in Figures 12 and 13 provide the necessary impedance match for NF and input return loss. Circuit board and input matching structure losses on the input of the amplifier directly add to the overall NF of the amplifier. It is critical to minimize RF trace lengths and to use high-Q components to achieve optimal NF performance.

Components R2 and C14 provide self biasing for the device and RF grounding for one of the two source leads. Components C5 and L3 are placed on the opposing source lead and are used to tune the transistor’s source inductance.

The effect of source inductance varies with frequency. Too little source inductance increases gain and high frequency stability, but at the cost of decreased in-band stability. Too much source inductance decreases high frequency stability and gain, but increases in-band stability. It is very important to find the optimum tuning of source inductance that balances all of these variables.

The output matching topology is typical for an RF transistor. Component L3 is the RF choke that prevents RF signals from reaching the DC supply. Component C4 is the DC blocking capacitor. Components C10 and C11 improve output return loss and 3rd Order Output Intercept Point (OIP3) performance.

Electrical and Mechanical Specifications

The absolute maximum ratings of the SKY65051-377LF are provided in Table 3. The recommended operating conditions are specified in Table 4 and electrical specifications are provided in Table 5.

Performance characteristics for the SKY65051-377LF are illustrated in Figures 3 through 11.

Table 3. SKY65051-377LF Absolute Maximum Ratings

Parameter	Symbol	Minimum	Typical	Maximum	Units
Input power	P _{IN}			+10	dBm
Output power	P _{OUT}			+20	dBm
Drain source voltage	V _{DS}		6.0		V
Gate source voltage	V _{GS}		-5.0		V
Gate drain voltage	V _{GD}		-5.0		V
Drain current	I _{DS}		55		mA
Gate current	I _{GS}		100		μA
Power dissipation	P _{DIS}		240		mW
Channel temperature	T _{CHAN}		150		°C
Storage temperature	T _{STG}	-65		+125	°C
Operating temperature	T _{OP}	-40		+85	°C

Note: Exposure to maximum rating conditions for extended periods may reduce device reliability. There is no damage to device with only one parameter set at the limit and all other parameters set at or below their nominal value.

CAUTION: Although this device is designed to be as robust as possible, Electrostatic Discharge (ESD) can damage this device. This device must be protected at all times from ESD. Static charges may easily produce potentials of several kilovolts on the human body or equipment, which can discharge without detection. Industry-standard ESD precautions should be used at all times.

Table 4. SKY65051-377LF Recommended Operating Conditions

Parameter	Symbol	Minimum	Typical	Maximum	Units
Supply voltage	V _{DD}	2	3	5	V
Supply current	I _{DD}	5	20	50	mA

Table 5. SKY65051-377LF Electrical Specifications (Note 1)

($T_{OP} = +25\text{ }^{\circ}\text{C}$, Characteristic Impedance [Z_0] = $50\ \Omega$, $V_{DD} = 3\ \text{V}$, $I_{DD} = 20\ \text{mA}$, Parameters Include a 2.4 GHz Matching Network, Unless Otherwise Noted)

Parameter	Symbol	Test Condition	Min	Typical	Max	Units
Saturated drain current	I_{BSS}	$V_{DS} = 2\ \text{V}$, $V_{GS} = 0\ \text{V}$	40	55	70	mA
Pinchoff voltage	V_P	$V_{DS} = 2\ \text{V}$, $I_{BS} = 2.5\%$ of I_{BSS}	-0.95	-0.80	-0.65	V
Transconductance	g_M	$V_{DS} = 2\ \text{V}$, $g_M = \Delta I_{BS} / \Delta V_{GS}$, measured at $I_{BS} = 20\%$ of I_{BSS}	40	80	120	mS
Gate leakage current	I_{GSS}	$V_{GD} = V_{GS} = -3\ \text{V}$		1	200	μA
Noise Figure	NF1 (Note 2)	@ 2.4 GHz		0.40	0.85	dB
	NF2 (Note 3)			0.65		dB
Gain	$ S_{21} $	@ 2.4 GHz	13.5	15.5	17.5	dB
Input return loss	$ S_{11} $	@ 2.4 GHz		-25		dB
Output return loss	$ S_{22} $	@ 2.4 GHz		-8		dB
Reverse isolation	$ S_{12} $	@ 2.4 GHz		-23.5		dB
3 rd Order Output Intercept Point	OIP3	$P_{OUT} = -10\ \text{dBm}/\text{tone}$, $\Delta F = 1\ \text{MHz}$, @ 2.4 GHz		+24.0		dBm
3 rd Order Input Intercept Point	IIP3	$P_{OUT} = -10\ \text{dBm}/\text{tone}$, $\Delta F = 1\ \text{MHz}$, @ 2.4 GHz		+8.5		dBm
1 dB Output Compression Point	OP1dB	@ 2.4 GHz		+12.0		dBm
1 dB Input Compression Point	IP1dB	@ 2.4 GHz		-2.5		dBm
Stability		Unconditionally stable, DC - 18 GHz		>1		K

Note 1: Performance is guaranteed only under the conditions listed in this Table.

Note 2: NF of device only. Input RF connector, board, and input matching network loss de-embedded from measurement.

Note 3: NF of device and matching network. Input RF connector and board loss de-embedded from measurement.

Typical Performance Characteristics

Evaluation Board Description

The SKY65051-377LF Evaluation Board is used to test the performance of the SKY65051-377LF low noise transistor. An assembly drawing for the Evaluation Board is shown in Figure 12. The Evaluation Board schematic diagram is shown in Figure 13. Table 6 provides the Bill of Materials (BOM) list for Evaluation Board components.

The board is populated for 2.4 GHz operation and contains a separate probe footprint for general device testing or source and load pull characterization. The board is provisioned with two RF connectors and a 3-pin DC launch. The RF connector and board loss up to component C1 is approximately 0.15 dB at 2.4 GHz.

Board material is 10 mil thick VT47 FR4 with 1 oz. copper cladding. RF input and output traces are 50 Ω.

Caution: Do not ground the exposed pad.

Evaluation Board Test Procedure

- Step 1: Connect RF test equipment to amplifier input/output SMA connectors.
- Step 2: Connect DC ground.
- Step 3: Connect VDD to a +3 V supply with a current limit of 60 mA. Verify that the board draws approximately 20 mA.
- Step 4: Apply RF signal or noise source and verify performance detailed in Table 5.

Package Dimensions

Package dimensions for the 4-pin QFN are shown in Figure 14, and tape and reel dimensions are provided in Figure 15.

Package and Handling Information

Since the device package is sensitive to moisture absorption, it is baked and vacuum packed before shipping. Instructions on the shipping container label regarding exposure to moisture after the container seal is broken must be followed. Otherwise, problems related to moisture absorption may occur when the part is subjected to high temperature during solder assembly.

THE SKY65051-377LF is rated to Moisture Sensitivity Level 1 (MSL1) at 260 °C. It can be used for lead or lead-free soldering.

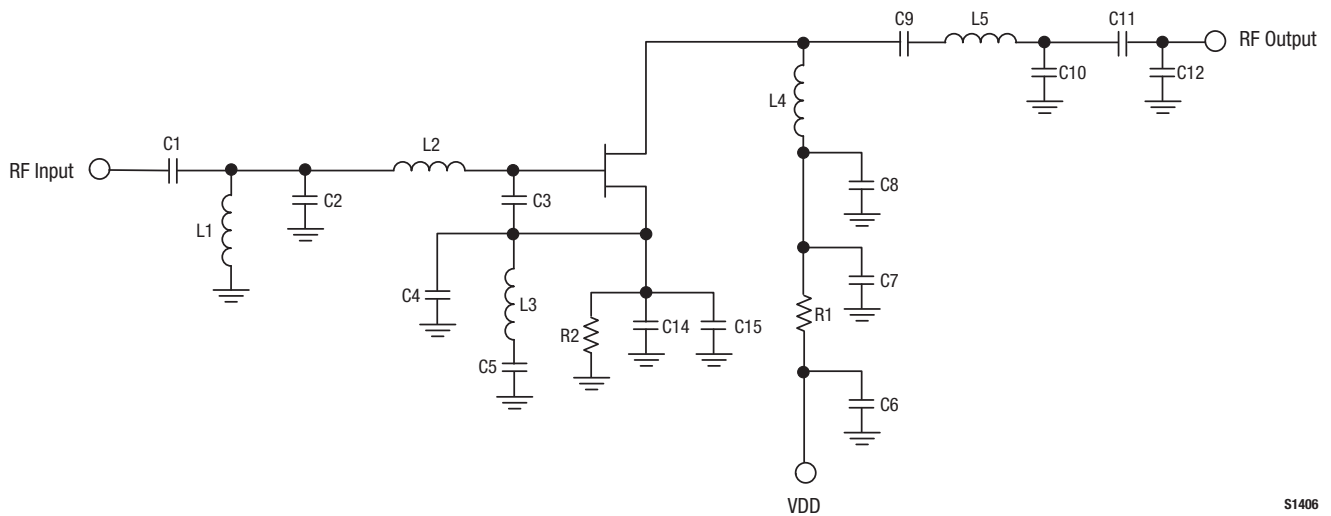

Care must be taken when attaching this product, whether it is done manually or in a production solder reflow environment. Production quantities of this product are shipped in a standard tape and reel format.

Caution: Do not ground the exposed pad.
