ACPM-7357

UMTS Dual-Band 4x5mm Power Amplifier Module (Band1/Band8)

Data Sheet

Description

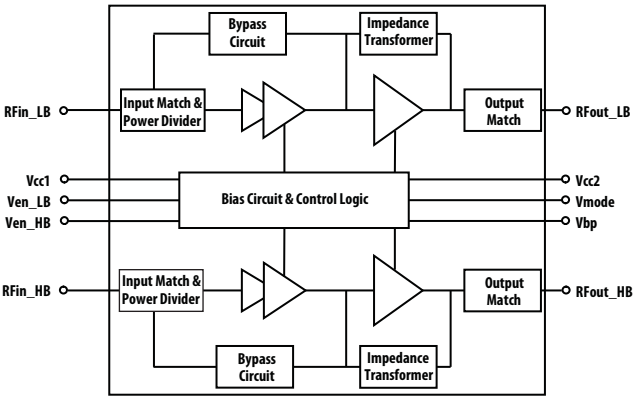
The ACPM-7357 is a dual-band PAM (Power Amplifier Module) designed for UMTS Band1 and Band8. The ACPM-7357 meets stringent UMTS linearity requirements. The 4mmx5mm form factor 14-pin surface mount package is self contained, incorporating 50ohm input and output matching networks

The ACPM-7357 features 5th generation of CoolPAM circuit technology which supports 3 modes – bypass, mid and high power modes. The CoolPAM is stage bypass technology which enables power amplifier to lower power consumption. Active bypass feature is added to 5th generation to enhance power added efficiency at low output range and this technology extends talk time of mobiles more by further saving power amplifier's current consumption.

The power amplifier is manufactured on an advanced InGaP HBT (hetero-junction Bipolar Transistor) MMIC (microwave monolithic integrated circuit) technology offering state-of-the-art reliability, temperature stability and ruggedness

The Module is housed in a cost effective, small and thin 4x5mm package.

Block Diagram



Features

- Dual-Band PA (Band1 and Band8)
- Small Size (4x5mm)
- Thin Package (1.0mm typ)
- Excellent Linearity
- 3-mode power control
  Bypass / Mid Power Mode / High Power Mode
- High Efficiency at max output power
- 14-pin surface mounting package
- Internal 50ohm matching networks for both RF input and output
- Lead-free, RoHS compliant, Green

Applications

- UMTS Band1 and Band8

Ordering Information

Part Number	Number of Devices	Container
ACPM-7357-TR1	1000	178mm (7") Tape/Reel
ACPM-7357-BLK	100	Bulk

Absolute Maximum Ratings

No damage assuming only one parameter is set at limit at a time with all other parameters set at or below typical value.

Operation of any single parameter outside these conditions with the remaining parameters set at or below typical values may result in permanent damage

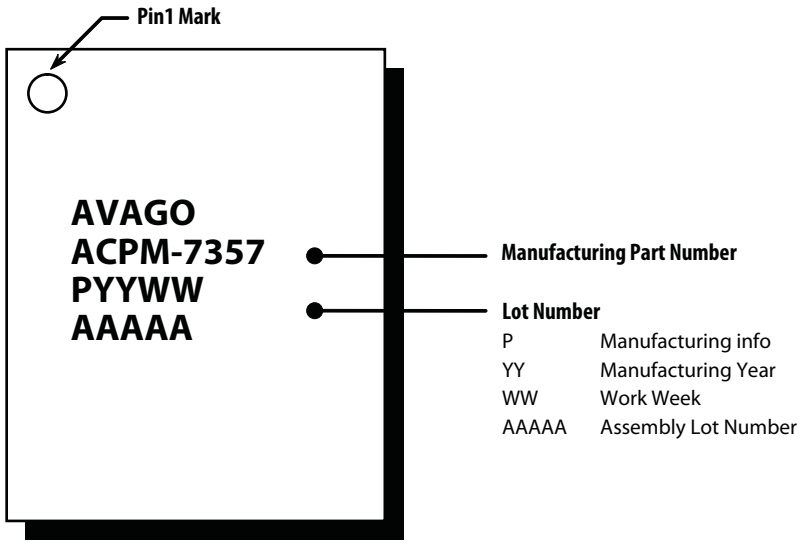
Marking Specification



CoolPAM

Avago Technologies' CoolPAM is stage-bypass PA technology which saves more power compared with conventional PA. With this technology, the ACPM-7357 has very low quiescent current, and efficiencies at low and medium output power ranges are high.

Incorporation of bias circuit

The ACPM-7357 has internal bias circuit, which removes the need for external constant voltage source (LDO). PA on/off is controlled by Ven. This is digitally control pin.

3-mode power control with two mode control pins

The ACPM-7357 supports three power modes (bypass power mode/mid power mode/high power mode) with two mode control pins (Vmode and Vbp). This control scheme enables the ACPM-7357 to save power consumption more, which accordingly gives extended talk time.

PDF (probability density function) in the Figure 1. showing distribution of output power of mobile in real field gives motivation for stage-bypass PA. Output power is less than 16dBm for most of operating time (during talking), so it is important to save power consumption at low and medium output power ranges.

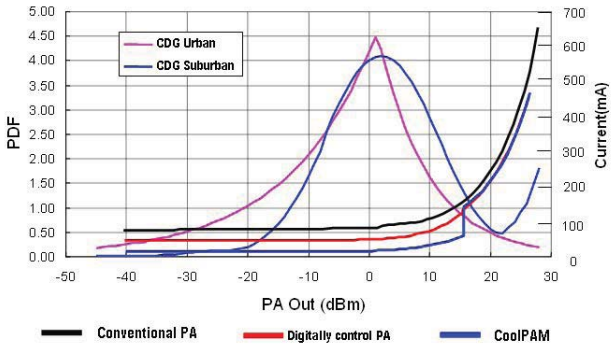


Figure 1. PDF and Current

Average current & Talk time

Average current consumed by PA can be calculated by summing up current at each output power weighted with probability. So it is expressed with integration of multiplication of current and probability at each output power.

$$\text{Average current} = \int (\text{PDF} \times \text{Current})\, dp$$

Talk time is extended more as average current consumption is lowered.

Mode control pins

Vmode and Vbp are digitally controlled by baseband and they control the operating mode of the PA. The logic table is summarized in the below table. These pins do not require constant voltage for interface.

Power Mode	Ven_Low, Ven_Hi	Vbp	Vmode	Pout (Rel99)	Pout (HSDPA, HSUPA MPR=0dB)
High Power Mode	HIGH	LOW	LOW	~27.0dBm (Band1) ~27.5dBm(Band8)	~26.0dBm (Band1) ~ 26.5dBm (Band8)
Mid Power Mode	HIGH	LOW	HIGH	~17dBm	~16dBm
Bypass Mode	HIGH	HIGH	HIGH	~8dBm	~7dBm
Shut Down Mode	LOW	LOW	LOW	–	–

Operating logic table.

UMTS PA performance comparison

– CoolPAM 4 and CoolPAM 5

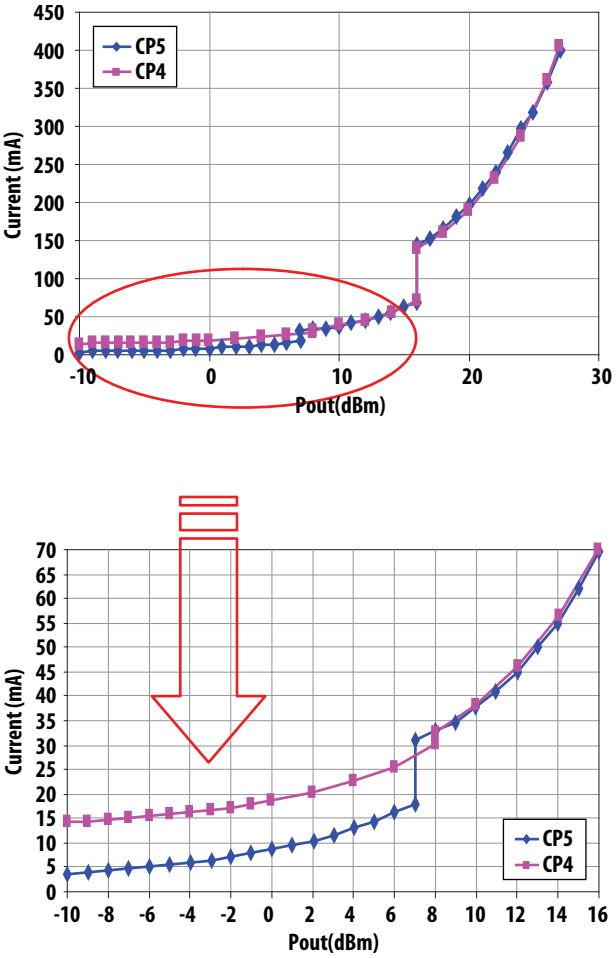

Figure 2. Icc Comparison of CP5 to CP4 (Avago CoolPAM)

The 5th generation of CoolPAM technology, ACPM-7357 can dramatically reduce Icc down to 3mA at bypass mode, which improves overall talk time and battery usage time of handset more compared with the CP4.

Application on mobile phone board

The figure 3 shows an application example in mobile. C5 and C6 should be placed close to pin4 and pin11. Bypass cap C1, C2, C3 and C4 should be also placed nearby from pin2, pin3, pin5 and pin6, respectively. The length of post-PA transmission line should be minimized to reduce line loss.

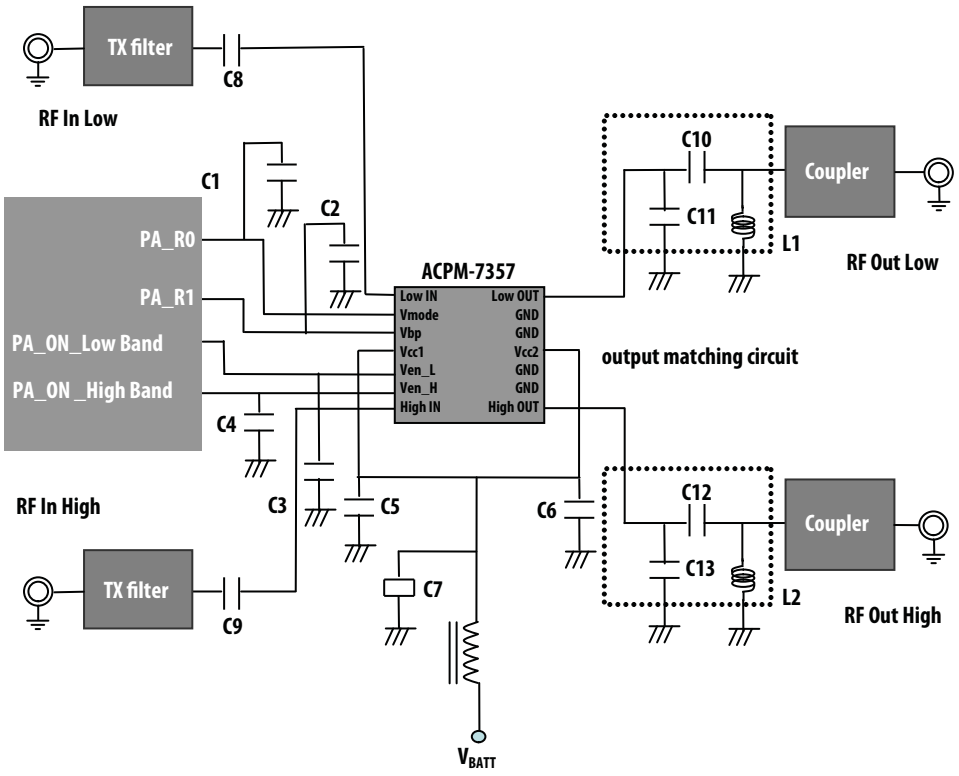

Figure 3. Peripheral Circuits

PCB layout and part placement on phone board

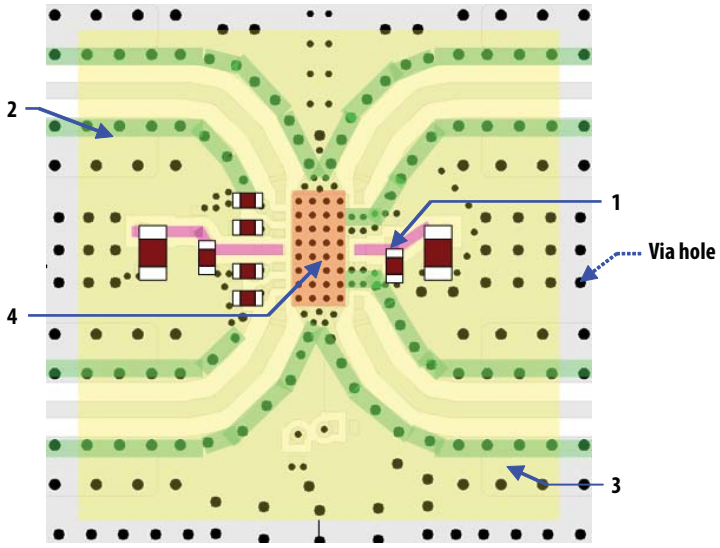

Figure 4. PCB guideline on phone board

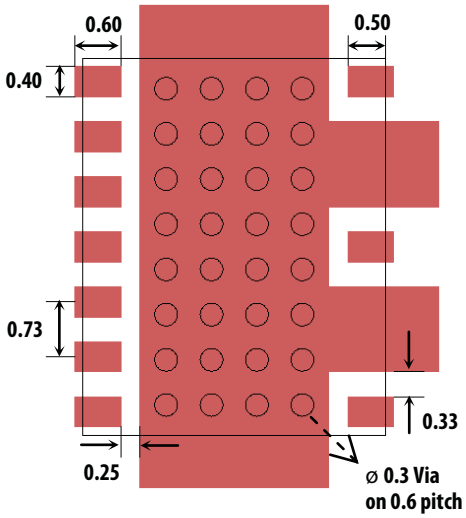
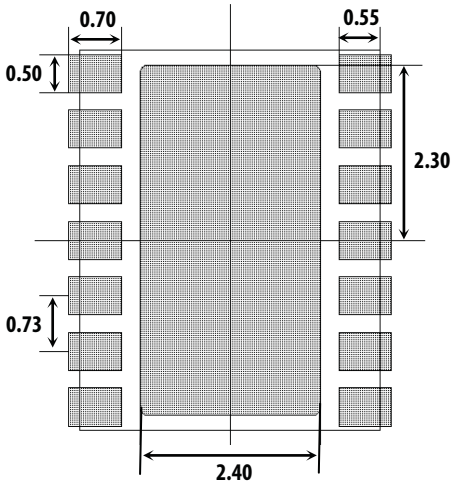
Notes:

1. To prevent voltage drop, make the bias lines as wide as possible (Pink line).
2. Use many via holes to fence off PA RF input and output traces for better isolation. Output signal of the PA should be isolated from input signal and the receive signal. Output signal should not be fed into PA input. (Green line)
3. Use via holes to connect outer ground plates to internal ground planes. They help heat spread out more easily and accordingly the board temperature can be lowered. They also help to improve RF stability (Yellow square).
4. PA which has a ground slug requires many via holes which go through all the layers (Red square).

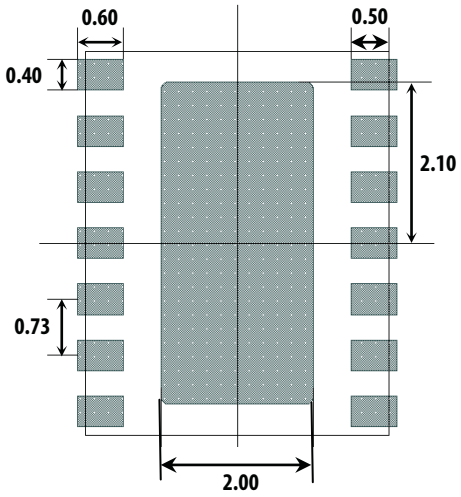
Metallization



Solder Mask Opening



Solder Paste Stencil Aperture



PCB Design Guidelines

The recommended PCB land pattern is shown in figures on the left side. The substrate is coated with solder mask between the I/O and conductive paddle to protect the gold pads from short circuit that is caused by solder bleeding/bridging.

Stencil Design Guidelines

A properly designed solder screen or stencil is required to ensure optimum amount of solder paste is deposited onto the PCB pads.

The recommended stencil layout is shown here. Reducing the stencil opening can potentially generate more voids. On the other hand, stencil openings larger than 100% will lead to excessive solder paste smear or bridging across the I/O pads or conductive paddle to adjacent I/O pads. Considering the fact that solder paste thickness will directly affect the quality of the solder joint, a good choice is to use laser cut stencil composed of 0.100mm(4mils) or 0.127mm(5mils) thick stainless steel which is capable of producing the required fine stencil outline.

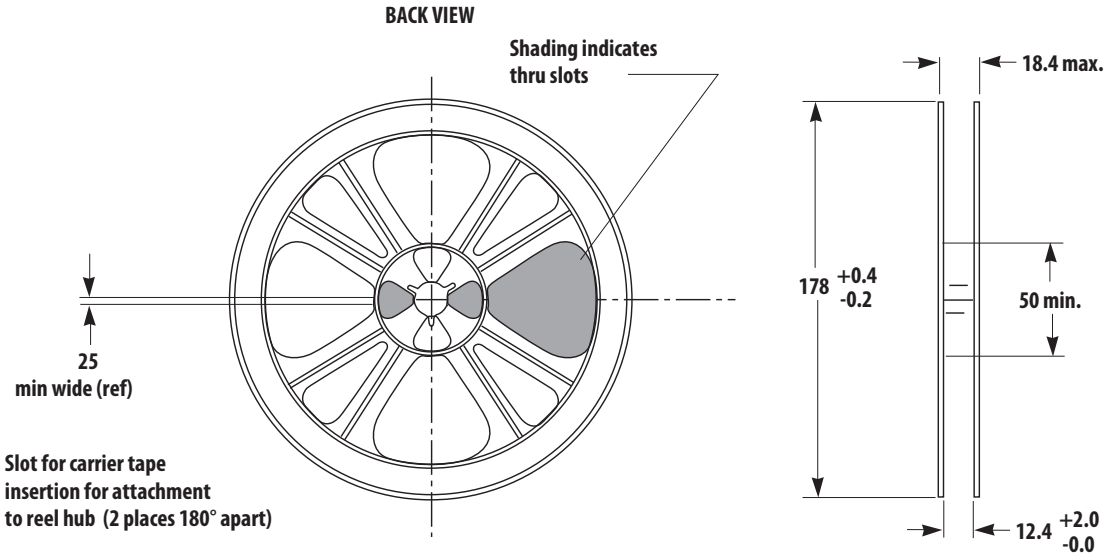
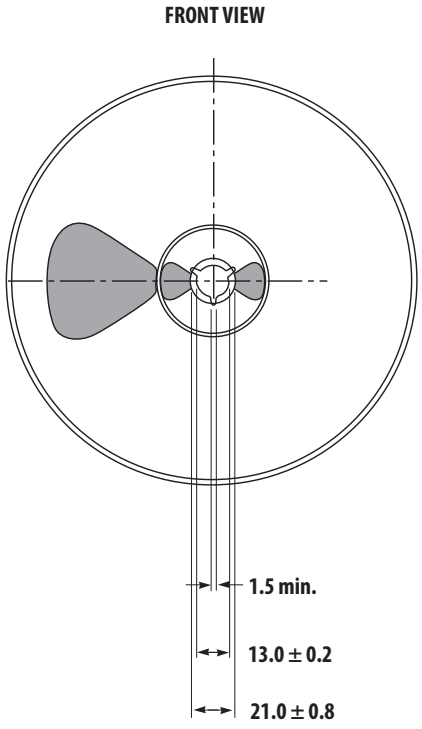
Reel Drawing





NOTES:

1. Reel shall be labeled with the following information (as a minimum).
   a. manufacturers name or symbol
   b. Avago Technologies part number
   c. purchase order number
   d. date code
   e. quantity of units
2. A certificate of compliance (c of c) shall be issued and accompany each shipment of product.
3. Reel must not be made with or contain ozone depleting materials.
4. All dimensions in millimeters (mm)

Plastic Reel Format (all dimensions are in millimeters)

Handling and Storage

ESD (Electrostatic Discharge)

Electrostatic discharge occurs naturally in the environment. With the increase in voltage potential, the outlet of neutralization or discharge will be sought. If the acquired discharge route is through a semiconductor device, destructive damage will result.

ESD countermeasure methods should be developed and used to control potential ESD damage during handling in a factory environment at each manufacturing site.

MSL (Moisture Sensitivity Level)

Plastic encapsulated surface mount package is sensitive to damage induced by absorbed moisture and temperature.

Avago Technologies follows JEDEC Standard J-STD 020B. Each component and package type is classified for moisture sensitivity by soaking a known dry package at various temperatures and relative humidity, and times. After soak, the components are subjected to three consecutive simulated reflows.

The out of bag exposure time maximum limits are determined by the classification test describe below which corresponds to a MSL classification level 6 to 1 according to the JEDEC standard IPC/JEDEC J-STD-020B and J-STD-033.

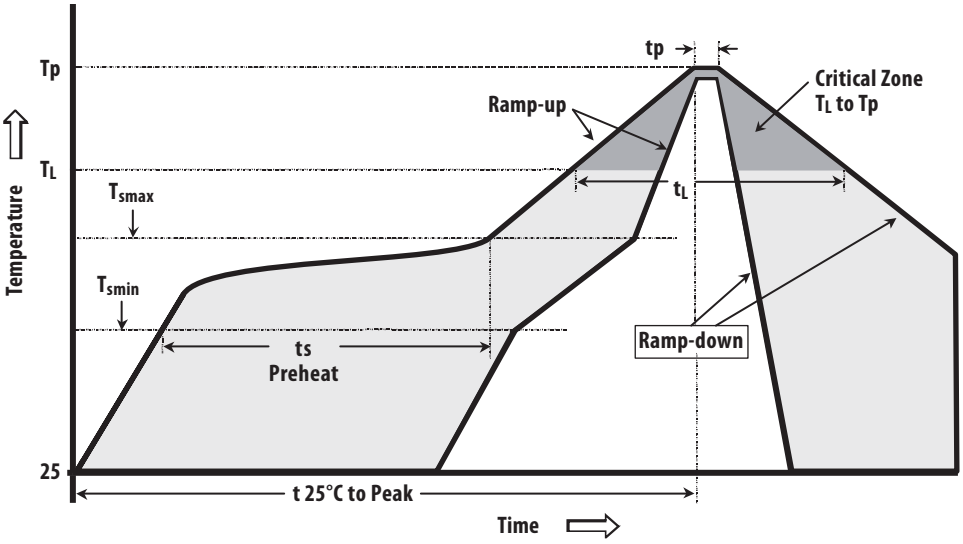
ACPM-7357 is MSL3. Thus, according to the J-STD-033 p.10, the maximum Manufacturers Exposure Time (MET) for this part is 168 hours. After this time period, the part would need to be removed from the reel, de-taped and then re-baked. MSL classification reflow temperature for the ACPM-7357 is targeted at 260°C +0/-5°C. Figure and table on next page show typical SMT profile for maximum temperature of 260 +0/-5°C.

Moisture Classification Level and Floor Life

MSL Level	Floor Life (out of bag) at factory ambient =< 30°C/60% RH or as stated
1	Unlimited at =< 30°C/85% RH
2	1 year
2a	4 weeks
3	168 hours
4	72 hours
5	48 hours
5a	24 hours
6	Mandatory bake before use. After bake, must be reflowed within the time limit specified on the label

Note :
1. The MSL Level is marked on the MSL Label on each shipping bag.

Reflow Profile Recommendations



Typical SMT Reflow Profile for Maximum Temperature = 260 +0/-5°C

Typical SMT Reflow Profile for Maximum Temperature = 260 +0/ -5°C

Profile Feature	Sn-Pb Solder	Pb-Free Solder
Average ramp-up rate (TL to TP)	3°C/sec max	3°C/sec max
Preheat – Temperature Min (Tsmin) – Temperature Max (Tsmax) – Time (min to max) (ts)	 100°C 150°C 60-120 sec	 150°C 200°C 60-120 sec
Tsmax to TL – Ramp-up Rate		 3°C/sec max
Time maintained above: – Temperature (TL) – Time (TL)	 183°C 60-150 sec	 217°C 60-150 sec
Peak temperature (Tp)	240 +0/-5°C	260 +0/-5°C
Time within 5°C of actual Peak Temperature (tp)	10-30 sec	20-40 sec
Ramp-down Rate	6°C/sec max	6°C/sec max
Time 25°C to Peak Temperature	6 min max.	8 min max.

Storage Condition

Packages described in this document must be stored in sealed moisture barrier, antistatic bags. Shelf life in a sealed moisture barrier bag is 12 months at <40°C and 90% relative humidity (RH) J-STD-033 p.6.

Out-of-Bag Time Duration

After unpacking the device must be soldered to the PCB within 168 hours with factory conditions <30°C and 60% RH as listed in the Table 5-1 on the J-STD-020D p.6.

Baking

It is not necessary to re-bake the part if both conditions (storage conditions and out-of bag conditions) have been satisfied. Baking must be done if at least one of the conditions above has not been satisfied. The baking conditions are listed in the Table 4-1 on the J-STD-033 p.8.

CAUTION

Tape and reel materials typically cannot be baked at the temperature described above. If out-of-bag exposure time is exceeded, parts must be baked for a longer time at low temperatures, or the parts must be de-reeled, de-taped, re-baked and then put back on tape and reel. (See moisture sensitive warning label on each shipping bag for information of baking).

Board Rework
Component Removal, Rework and Remount

If a component is to be removed from the board, it is recommended that localized heating be used and the maximum body temperatures of any surface mount component on the board not exceed 200°C. This method will minimize moisture related component damage. If any component temperature exceeds 200°C, the board must be baked dry per 4-2 prior to rework and/or component removal. Component temperatures shall be measured at the top center of the package body. Any SMD packages that have not exceeded their floor life can be exposed to a maximum body temperature as high as their specified maximum reflow temperature.

Removal for Failure Analysis

Not following the above requirements may cause moisture/reflow damage that could hinder or completely prevent the determination of the original failure mechanism.

Baking of Populated Boards

Some SMD packages and board materials are not able to withstand long duration bakes at 125°C. Examples of this are some FR-4 materials, which cannot withstand a 24 hr bake at 125°C. Batteries and electrolytic capacitors are also temperature sensitive. With component and board temperature restrictions in mind, choose a bake temperature from Table 4-1 in J-STD 033; then determine the appropriate bake duration based on the component to be removed. For additional considerations see IPC-7711 andIPC-7721.

Derating due to Factory Environmental Conditions

Factory floor life exposures for SMD packages removed from the dry bags will be a function of the ambient environmental conditions. A safe, yet conservative, handling approach is to expose the SMD packages only up to the maximum time limits for each moisture sensitivity level as shown in table of Moisture Classification Level and Floor Life. This approach, however, does not work if the factory humidity or temperature is greater than the testing conditions of 30°C/60% RH. A solution for addressing this problem is to derate the exposure times based on the knowledge of moisture diffusion in the component package materials ref. JESD22-A120). Recommended equivalent total floor life exposures can be estimated for a range of humidities and temperatures based on the nominal plastic thickness for each device.

Table on follwoing page lists equivalent derated floor lives for humidities ranging from 20-90% RH for three temperature, 20°C, 25°C, and 30°C.

This table is applicable to SMDs molded with novolac, biphenyl or multifunctional epoxy mold compounds. The following assumptions were used in calculating this table:

1. Activation Energy for diffusion = 0.35eV (smallest known value).
2. For ≤60% RH, use Diffusivity = 0.121exp (-0.35eV/kT) mm2/s (this used smallest known Diffusivity @ 30°C).
3. For >60% RH, use Diffusivity = 1.320exp (-0.35eV/kT) mm2/s (this used largest known Diffusivity @ 30°C).

Recommended Equivalent Total Floor Life (days) @ 20°C, 25°C & 30°C, 35°C

For ICs with Novolac, Biphenyl and Multifunctional Epoxies (Reflow at same temperature at which the component was classified) Maximum Percent Relative Humidity
