

MGA-43328

(2.5–2.7) GHz 29dBm High Linearity Wireless Data Power Amplifier

Data Sheet

Description

Avago Technologies' MGA-43328 is a power amplifier for use in the (2.5-2.7)GHz band. High linear output power at 5V is achieved through the use of Avago Technologies' proprietary 0.25um GaAs Enhancement-mode pHEMT process. It is housed in a miniature 5.0mm x 5.0mm x 0.85mm 28-lead QFN package. It also includes shutdown and switchable gain functions. A detector is also included on-chip. The compact footprint coupled with high gain and high efficiency make the MGA-43328 an ideal choice as a power amplifier for IEEE 802.16 (WiMAX) and WLL applications.

Component Image

5.0 x 5.0 x 0.85 mm³ 28-lead QFN Package (Top View)

Notes:

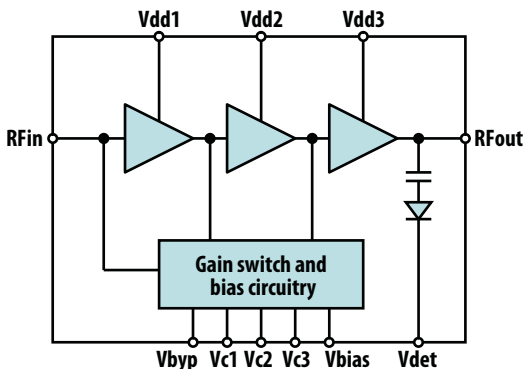

Package marking provides orientation and identification

"43328" = Device part number

"YYWW" = Year and work week

"XXXX" = Assembly lot number

Functional Block Diagram

Features

- High gain: 37.3dB
- High linearity performance: 29.3dBm at 5V supply (2.5% EVM, 64-QAM 3/4 FEC rate OFDMA, 10MHz bandwidth)
- High efficiency: 16.6%
- Built-in detector and shutdown switches
- Switchable gain: 24.5dB attenuation using one single CMOS compatible switch pin
- ETSI spectral mask compliant at 29dBm output power
- GaAs E-pHEMT Technology^[1]
- Low cost small package size: 5.0 x 5.0 x 0.85 mm³
- MSL-2a and lead-free
- Usable at 3.3V supply for lower supply voltage applications

Specifications

2.6GHz; Vdd = Vbias = 5.0V, Vc = 2.1V (R2 = 1.0kΩ, R3 = 390Ω, R4 = 1.1kΩ as shown in Figure 36), Iqtotal = 470mA (typ), IEEE 802.16e 64-QAM OFDMA, 3/4 FEC rate

- 37.3 dB Gain
- 29.3 dBm Linear Pout (2.5% EVM)
- 16.6% PAE @ Linear Pout
- 2.6V Vdet @ Linear Pout
- 24.5 dB Switchable Gain Attenuation
- 25μA Shutdown Current

Applications

- High linearity amplifier for IEEE 802.16 fixed terminal amplifier
- WLL amplifier

Note:

1. Enhancement mode technology employs positive Vgs, thereby eliminating the need of negative gate voltage associated with conventional depletion mode devices.

Absolute Maximum Rating^[1] T_A=25°C

Symbol	Parameter	Units	Absolute Max.
V _{dd} , V _{bias}	Supply voltages, bias supply voltage	V	6.0
V _c	Control Voltage	V	(V _{dd})
P _{in,max}	CW RF Input Power	dBm	20
P _{diss}	Total Power Dissipation ^[3]	W	8.0
T _{j,MAX}	Junction Temperature	°C	150
T _{STG}	Storage Temperature	°C	-65 to 150

Thermal Resistance

Thermal Resistance ^[2]

$$\theta_{JB} = 11.7^{\circ}\text{C/W}$$

Notes:

1. Operation of this device in excess of any of these limits may cause permanent damage.
2. Thermal resistance measured using Infra-Red Measurement Technique.
3. Board temperature (T_B) is 25°C, for T_B > 56.4°C derate the device power at 85.5mW per °C rise in board temperature adjacent to package bottom.

Electrical Specifications

T_A = 25°C, V_{dd} = V_{bias} = 5.0V, V_c = 2.1V (R₂ = 1.0kΩ, R₃ = 390Ω, R₄ = 1.1kΩ as shown in Figure 36), V_{byp} = 0V, I_{qtotal} = 470mA, RF performance at 2.6 GHz, IEEE 802.16e 64-QAM, ¾ rate FEC, 10MHz bandwidth OFDMA operation unless otherwise stated.

Symbol	Parameter and Test Condition	Units	Min.	Typ.	Max.
V _{dd}	Supply Voltage	V		5.0	
I _{qtotal}	Quiescent Supply Current (normal high gain mode)	mA		470	
	Quiescent Supply Current (low gain mode, V _{byp} = 5.0V)	mA		470	
Gain	Gain	dB	35.0	37.3	
OP1dB	Output Power at 1dB Gain Compression	dBm		35.5	
P _{out_5V}	Linear Output Power @ 2.5% EVM with 64-QAM OFDMA modulation per IEEE 802.16e specs, 50% duty cycle, ¾ rate FEC	dBm	27.7	29.3	
I _{total_5V}	Total current draw at P _{out_5V} level	mA		1017	1250
S ₁₁	Input Return Loss, 50Ω source	dB		-12	
S ₂₂	Output Return Loss, 50Ω source	dB		-11	
S ₁₂	Reverse Isolation	dB		60	
Atten	Gain attenuation in low gain mode	dB	21.5	24.5	27.5
V _{det}	Detector output DC voltage @ 29dBm linear P _{out}	V		2.6	
DetR	Detector RF dynamic range	dB		10	
NF	Noise figure	dB		2.1	
S	Stability under load VSWR of 6:1 (all phase angle), spurious output	dBc			-60

Notes:

1. S-parameter is measured with deembedded reference plane at DUT RFin and RFout pins.
2. R2 = 1.2k Ω , R3 = 300 Ω , R4 = 1.2k Ω as shown in Figure 36.

R2	1.0kΩ	RK73B1ETTD102J
R3	390Ω	RK73B1ETTD391J
R4	1.1kΩ	RK73B1ETTD112J

Note:

For performance optimization, control voltage for individual stages can be adjusted by varying R2, R3 and R4 resistor values.

Application board pin header assignments

- Pin 1 : Vdd3 (Sense)
 - Pin 2 : Vdd3 (Force)
 - Pin 3 : Vdd2 (Sense)
 - Pin 4 : Vdd2 (Force)
 - Pin 5 : Vdd1 (Sense)
 - Pin 6 : Vdd1 (Force)
 - Pin 13 : Vbyp
 - Pin 14 : Vc1 (Not used)
 - Pin 15 : Vc2
 - Pin 16 : Vc3 (Not used)
 - Pin 17 : Vbias
 - Pin 18 : Vdet
- Other pins are grounded*

Figure 35. Demonstration board application circuit for MGA-43328 module

Application Schematic

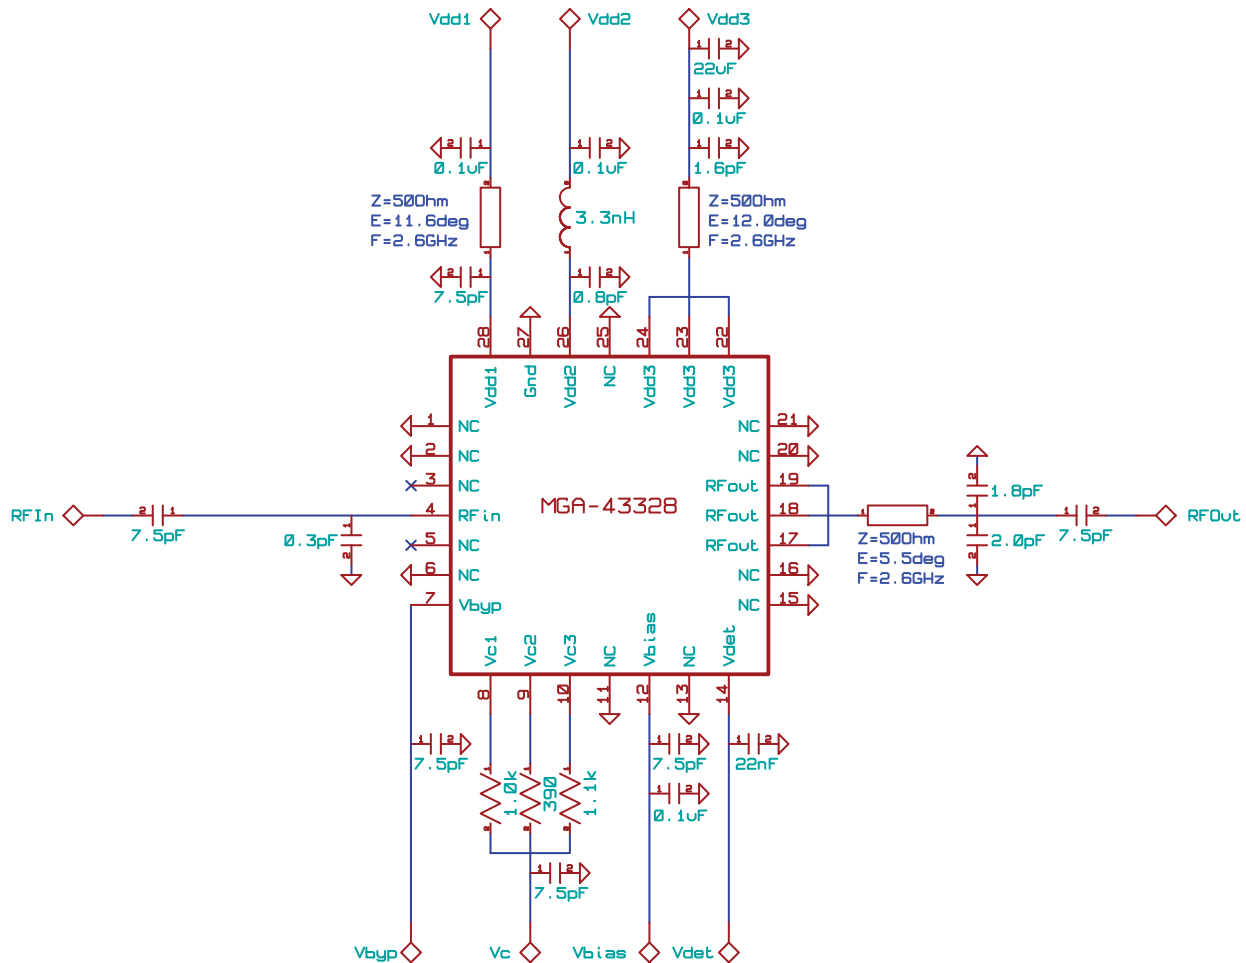

Figure 36. Application schematic in demonstration board

Notes:

- In normal gain mode operation, Vbyp = 0V. Vc1, Vc2 and Vc3 are bias pins that are used to set the bias conditions to the 3 internal gain stages of the PA.
- Typical quiescent current distribution with Vdd1 = Vdd2 = Vdd3 = Vbias = 5V, Vbyp = 0V, Vc = 2.1V is :
 - I_{dd1} = 55.5 mA
 - I_{dd2} = 146 mA
 - I_{dd3} = 268.5 mA
 - I_{bias} = 16.5mA
 (Note: Vc supplied through Vc2 pin on demonstration board with R₂ = 1.0kΩ, R₃ = 390Ω and R₄ = 1.1kΩ)
- Low gain mode is enabled by setting Vbyp pin to 5V. This condition overrides the normal high gain mode operation and bypasses the first gain stage, regardless of the voltage at Vc1 pin.
- Modulated signal measurements are made with Agilent 89600 VSA and Agilent E4438C signal generator with IEEE 802.16e option using the following test conditions :
 - Signal format: IEEE 802.16e OFDMA, ¾ rate FEC
 - Modulation: 64-QAM
 - Number of Subcarriers: 840
 - Modulation bandwidth: 10 MHz
 - Downlink ratio: 50%
 Residual distortion of signal generator: (0.6-0.8)%. This distortion is not removed from the overall EVM data in the datasheet.
- Typical operating voltages and currents:
 - Normal gain mode : Vdd1 = Vdd2 = Vdd3 = Vbias = 5V. Vc = 2.1V. Vbyp = 0V. I_q(total) = 470 mA.
 - Low gain mode : Vdd1 = Vdd2 = Vdd3 = Vbias = 5V. Vc = 2.1V. Vbyp = 5V. I_q(total) = 470 mA.
- Vdd1/2/3 are shown as separate supplies with individual bypass capacitors. This yields the most stable configuration. If a common power supply line is used, proper broadband bypass decoupling is recommended to reduce common mode feedback through the supply line.
