

## FM car-radio tuner IC with intelligent selectivity system (ISS)

### Features

#### FM part

- RF AGC generation by RF and IF detection
- I/Q mixer for 1<sup>st</sup> FM IF 10.7 MHz with image rejection
- 2 programmable IF-gain stages
- Mixer for 2<sup>nd</sup> IF 450 kHz
- Internal 450 kHz bandpass filter with three bandwidths controlled by ISS
- Fully integrated FM-demodulator with noise cancellation

#### Additional features

- VCO for world tuning range
- High performance fast PLL for RDS-system
- IF counter with search stop signal
- Quality detector for level, deviation, adjacent channel and multipath
- Quality detection informations as analog signals external available
- ISS (intelligent selectivity system) for cancellation of adjacent channel and noise influences

- Adjacent channel mute
- Fully electronic alignment
- All functions I<sup>2</sup>C bus controlled

### Description

The TDA7512F is a high performance tuner circuit for FM car-radio. It contains mixer, IF amplifier, demodulator, quality detection, ISS filter and PLL synthesizer with IF counter on a single chip. Use of BiCMOS technology allows the implementation of several tuning functions and a minimum of external components.

## 4 Functional description

### 4.1 Mixer 1, AGC and 1.IF

FM quadrature I/Q-mixer converts RF to IF1 of 10.7MHz. The mixer provides inherent image rejection and wide dynamic range with low noise and large input signal performance. The mixer1 tank can be adjusted by software (IF1T). For accurate image rejection the gain- and phase-error generated as well in mixer as VCO stage can be compensated by software (G,PH)

It is capable of tuning the US FM, US weather, Europe FM, Japan FM and East Europe FM bands

- US FM = 87.9 to 107.9 MHz
- US weather = 162.4 to 162.55 MHz
- Europe FM = 87.5 to 108 MHz
- Japan FM = 76 to 91 MHz
- East Europe FM = 65.8 to 74 MHz

The AGC operates on different sensitivities and bandwidths in order to improve the input sensitivity and dynamic range. AGC thresholds are programmable by software (RFAGC,IFAGC,KAGC). The output signal is a controlled current for double pin diode attenuator. Two 10.7 MHz programmable amplifiers (IFG1, IFG2) correct the IF ceramic insertion loss and the costumer level plan application.

### 4.2 Mixer 2, limiter and demodulator

In this 2. mixer stage the first 10.7 MHz IF is converted into the second 450 kHz IF. A multi-stage limiter generates signals for the complete integrated demodulator without external tank. MPX output DC offset versus noise DC level is correctable by software (DEM).

### 4.3 Quality detection and ISS

#### 4.3.1 Fieldstrength

Parallel to mixer 2 input a 10.7 MHz limiter generates a signal for digital IF counter and a fieldstrength output signal. This internal unweighted fieldstrength is used for keying AGC, adjacent channel and multipath detection and is available at PIN14 (FSU) after +6dB buffer stage. The behaviour of this output signal can be corrected for DC offset (SL) and slope (SMSL). The internal generated unweighted fieldstrength is filtered at PIN35 and used for softmute function and generation of ISS filter switching signal for weak input level (sm).

#### 4.3.2 Adjacent channel detector

The input of the adjacent channel detector is AC coupled from internal unweighted fieldstrength. A programmable highpass or bandpass (ACF) and amplifier (ACG) as well as rectifier determines the influences. This voltage is compared with adjustable comparator1 thresholds (ACWTH, ACNTH). The output signal of this comparator generates a DC level at PIN15 by programmable time constant. Time control (TISS) for a present adjacent channel is made by charge and discharge current after comparator1 in an external capacitance. The

charge current is fixed and the discharge current is controlled by I<sup>2</sup>C Bus. This level produces digital signals (ac, ac+) in an additional comparator<sup>4</sup>. The adjacent channel information is available as analog output signal after rectifier and +8 dB output buffer.

### 4.3.3 Multipath detector

The input of the multipath detector is AC coupled from internal unweighted fieldstrength. A programmable bandpass (MPF) and amplifier (MPG) as well as rectifier determines the influences. This voltage is compared with an adjustable comparator<sup>2</sup> thresholds (MPTH). The output signal of this comparator 2 is used for the "Milano" effect. In this case the adjacent channel detection is switched off. The "Milano" effect is selectable by I<sup>2</sup>C bus (MPOFF). The multipath information is available as analog output signal after rectifier and +8 dB output buffer.

### 4.3.4 450 kHz IF narrow bandpass filter (ISS filter)

The device gets an additional second IF narrow bandpass filter for suppression of noise and adjacent channel signal influences. This narrow filter has three switchable bandwidths, narrow range of 80 kHz, mid range of 120 kHz and 30 kHz for weather band information.

Without ISS filter the IF bandwidth (wide range) is defined only by ceramic filter chain. The filter is switched in after mixer 2 before 450 kHz limiter stage. The centre frequency is matching to the demodulator center frequency.

### 4.3.5 Deviation detector

In order to avoid distortion in audio output signal the narrow ISS filter is switched OFF for present overdeviation. Hence the demodulator output signal is detected.

A lowpass filtering and peak rectifier generates a signal that is defined by software controlled current (TDEV) in an external capacitance. This value is compared with a programmable comparator<sup>3</sup> thresholds (DWITH, DTH) and generates two digital signals (dev, dev+). For weak signal condition deviation threshold is proportional to FSU.

### 4.3.6 ISS switch logic

All digital signals coming from adjacent channel detector, deviation detector and softmute are acting via switching matrix on ISS filter switch. The IF bandpass switch mode is controlled by software (ISSON, ISS30, ISS80, CTLOFF).

The switch ON of the IF bandpass is also available by external manipulation of the voltage at PIN15.

Two application modes are available (APPM). The conditions are described in table 34.

## 4.4 Soft Mute control

The external fieldstrength signal at PIN 35 is the reference for mute control. The startpoint and mute depth are programmable (SMTH, SMD) in a wide range. The time constant is defined by external capacitance. Additional adjacent channel mute function is supported.

A highpass filter with -3 dB threshold frequency of 100 kHz, amplifier and peak rectifier generates an adjacent noise signal from MPX output with the same time constant for

softmute. This value is compared with comparator5 thresholds (ACM). For present strong adjacent channel the MPX signal is additional attenuated (ACMD).

## 4.5 PLL and IF counter section

### 4.5.1 PLL frequency synthesizer block

This part contains a frequency synthesizer and a loop filter for the radio tuning system. Only one VCO is required to build a complete PLL system for FM world tuning . For auto search stop operation an IF counter system is available.

The counter works in a two stages configuration. The first stage is a swallow counter with a two modulus (32/33) precounter. The second stage is an 11-bit programmable counter.

The circuit receives the scaling factors for the programmable counters and the values of the reference frequencies via an I<sup>2</sup>C bus interface. The reference frequency is generated by an adjustable internal (XTAL) oscillator followed by the reference divider. The main reference and step-frequencies are free selectable (RC, PC).

Output signals of the phase detector are switching the programmable current sources. The loop filter integrates their currents to a DC voltage.

The values of the current sources are programmable by 6 bits also received via the I<sup>2</sup>C Bus (A, B, CURRH).

To minimize the noise induced by the digital part of the system, a special guard configuration is implemented. The loop gain can be set for different conditions by setting the current values of the chargepump generator.

### 4.5.2 Frequency generation for phase comparison

The RF signals applies a two modulus counter (32/33) pre-scaler, which is controlled by a 5-bit A-divider. The 5-bit register (PC0 to PC4) controls this divider. In parallel the output of the prescaler connects to an 11-bit B-divider. The 11-bit PC register (PC5 to PC15) controls this divider

Dividing range:

$$f_{VCO} = [33 \times A + (B + 1 - A) \times 32] \times f_{REF}$$

$$f_{VCO} = (32 \times B + A + 32) \times f_{REF}$$

Important: For correct operation:  $A \leq 32$ ;  $B \geq A$

### 4.5.3 Three state phase comparator

The phase comparator generates a phase error signal according to phase difference between  $f_{SYN}$  and  $f_{REF}$ . This phase error signal drives the charge pump current generator.

### 4.5.4 Charge pump current generator

This system generators signed pulses of current. The phase error signal decides the duration and polarity of those pulses. The current absolute values are programmable by A register for high current and B register for low current.

#### 4.5.5 Inlock detector

Switching the chargepump in low current mode can be done either via software or automatically by the inlock detector, by setting bit LDENA to "1".

After reaching a phase difference about lower than 40nsec the chargepump is forced in low current mode. A new PLL divider alternation by I<sup>2</sup>C-Bus will switch the chargepump in the high current mode.

#### 4.5.6 Low noise CMOS op-amp

An internal voltage divider at pin VREF2 connects the positive input of the low noise op-amp. The charge pump output connects the negative input. This internal amplifier in cooperation with external components can provide an active filter.

While the high current mode is activated LPHC output is switched on.

#### 4.5.7 IF counter block

The aim of IF counter is to measure the intermediate frequency of the tuner. The input signal is the 10.7MHz IF level after limiter.

The grade of integration is adjustable by eight different measuring cycle times. The tolerance of the accepted count value is adjustable, to reach an optimum compromise for search speed and precision of the evaluation.

#### 4.5.8 Sampling timer

A sampling timer generates the gate signal for the main counter. The basically sampling time are in FM mode 6.25kHz ( $t_{TIM}=160\mu s$ ).

This is followed by an asynchronous divider to generate several sampling times.

#### 4.5.9 Intermediate frequency main counter

This counter is a 11 - 21-bit synchronous autoreload down counter. Five bits (CF) are programmable to have the possibility for an adjust to the centre frequency of the IF-filter. The counter length is automatic adjusted to the chosen sampling time.

At the start the counter will be loaded with a defined value which is an equivalent to the divider value ( $t_{Sample} \times f_{IF}$ ).

If a correct frequency is applied to the IF counter frequency input at the end of the sampling time the main counter is changing its state from 0h to 1FFFFFFh.

This is detected by a control logic and an external search stop output is changing from LOW to HIGH. The frequency range inside which a successful count result is adjustable by the EW bits.

$$t_{CNT} = \frac{CF + 1696 + 1}{f_{IF}}$$

Counter result succeeded:

$$t_{TIM} \geq t_{CNT} - t_{ERR}$$

$$t_{TIM} \leq t_{CNT} + t_{ERR}$$

Counter result failed:

$$t_{TIM} > t_{CNT} + t_{ERR}$$

$$t_{TIM} < t_{CNT} - t_{ERR}$$

$t_{TIM}$  = IF timer cycle time (sampling time)

$t_{CNT}$  = IF counter cycle time

$t_{ERR}$  = discrimination window (controlled by the EW registers)

The IF counter is only started by inlock information from the PLL part. It is enabled by software (IFENA).

#### 4.5.10 Adjustment of the measurement sequence time

The precision of the measurements is adjustable by controlling the discrimination window. This is adjustable by programming the control registers EW.

The measurement time per cycle is adjustable by setting the registers IFS.

#### 4.5.11 Adjust of the frequency value

The center frequency of the discrimination window is adjustable by the control registers CF.

## 4.6 I<sup>2</sup>C bus interface

The TDA7512F supports the I<sup>2</sup>C bus protocol. This protocol defines any device that sends data onto the bus as a transmitter, and the receiving device as the receiver. The device that controls the transfer is a master and device being controlled is the slave. The master will always initiate data transfer and provide the clock to transmit or receive operations.

### 4.6.1 Data transition

Data transition on the SDA line must only occur when the clock SCL is LOW. SDA transitions while SCL is HIGH will be interpreted as START or STOP condition.

### 4.6.2 Start condition

A start condition is defined by a HIGH to LOW transition of the SDA line while SCL is at a stable HIGH level. This "START" condition must precede any command and initiate a data transfer onto the bus.

The device continuously monitors the SDA and SCL lines for a valid START and will not response to any command if this condition has not been met.

### 4.6.3 Stop condition

A STOP condition is defined by a LOW to HIGH transition of the SDA while the SCL line is at a stable HIGH level. This condition terminates the communication between the devices and forces the bus-interface of the device into the initial condition.

### 4.6.4 Acknowledge

Indicates a successful data transfer. The transmitter will release the bus after sending 8 bits of data. During the 9<sup>th</sup> clock cycle the receiver will pull the SDA line to LOW level to indicate it receive the eight bits of data.

### 4.6.5 Data transfer

During data transfer the device samples the SDA line on the leading edge of the SCL clock. Therefore, for proper device operation the SDA line must be stable during the SCL LOW to HIGH transition.

### 4.6.6 Device addressing

To start the communication between two devices, the bus master must initiate a start instruction sequence, followed by an eight bit word corresponding to the address of the device it is addressing.

The most significant 6 bits of the slave address are the device type identifier.

The TDA7512F device type is fixed as "110001".

The next significant bit is used to address a particular device of the previous defined type connected to the bus.

The state of the hardwired PIN 41 defines the state of this address bit. So up to two devices could be connected on the same bus. When PIN 41 is connected to VCC2 the address bit "1" is selected. When PIN 41 is left open the address bit "0" is selected. Therefore a double FM tuner concept is possible.

The last bit of the start instruction defines the type of operation to be performed:

- When set to "1", a read operation is selected
- When set to "0", a write operation is selected

The TDA7512F connected to the bus will compare their own hardwired address with the slave address being transmitted, after detecting a START condition. After this comparison, the TDA7512F will generate an "acknowledge" on the SDA line and will do either a read or a write operation according to the state of R/W bit.

### 4.6.7 Write operation

Following a START condition the master sends a slave address word with the R/W bit set to "0". The device will generate an "acknowledge" after this first transmission and will wait for a second word (the word address field). This 8-bit address field provides an access to any of the 32 internal addresses.

Upon receipt of the word address the TDA7512F slave device will respond with an "acknowledge". At this time, all the following words transmitted to the TDA7512F will be considered as Data.

The internal address will be automatically incremented. After each word receipt the TDA7512F will answer with an "acknowledge".

### 4.6.8 Read operation

If the master sends a slave address word with the R/W bit set to "1", the TDA7512F will transmit one 8-bit data word. This data word includes the following informations:

bit0 (ISS filter, 1 = ON, 0 = OFF)

bit1 (ISS filter bandwidth, 1 = 80kHz, 0 = 120kHz)

bit2 (MPOUT, 1 = multipath present, 0 = no multipath)

bit3 (1 = PLL is locked in , 0 = PLL is locked out).

bit4 (fieldstrength indicator, 1 = lower as softmute threshold, 0 = higher as softmute threshold)

bit5 (adjacent channel indicator, 1 = adjacent channel present, 0 = no adjacent channel)

bit6 (deviation indicator, 1 = strong overdeviation present, 0 = no strong overdeviation)

bit7 (deviation indicator, 1 = overdeviation present, 0 = no overdeviation)

## 5 Software specification

The interface protocol comprises:

- start condition (S)
- chip address byte
- subaddress byte
- sequence of data (N bytes + Acknowledge)
- stop condition (P)

**Figure 3. Interface protocol**

S = Start

P = Stop

ACK = Acknowledge

## 5.2 Control register function

**Table 7. Control register function**

Register Name	Function
A	Charge pump high current
ACF	Adjacent channel filter select
ACG	Adjacent channel filter gain
ACM	Threshold for startpoint adjacent channel mute
ACMD	Adjacent channel mute depth
ACNTH	Adjacent channel narrow band threshold
ACWTH	Adjacent channel wide band threshold
APPM	Application mode quality detection
B	Charge pump low current
BWCTL	ISS filter fixed bandwidth (ISS80) in automatic control
CASF	Check alternative station frequency
CF	Center frequency IF counter
CLKSEP	Clock separation (only for testing)
CTLOFF	Switch off automatic control of ISS filter
CURRH	Set current high charge pump

**Table 7. Control register function (continued)**

Register Name	Function
DEM	Demodulator offset
DNB	Demodulator noise spike blanking
DTH	Deviation detector threshold for ISS filter "OFF"
DWTH	Deviation detector threshold for ISS filter narrow/wide
EW	Frequency error window IF counter
F100K	Corner frequency of AC-mute high pass filter
G	I/Q mixer gain adjust
IF1T	Mixer1 tank adjust
IFAGC	IF AGC
IFENA	IF counter enable
IFG	IF1 amplifier gain (10.7MHz)
IFS	IF counter sampling time
ISSIN	Test input for ISS filter
ISSON	ISS filter "ON"
ISS30	ISS filter 30KHz weather band
ISS80	ISS filter narrow/mid switch
KAGC	Keying AGC
LDENA	Lock detector enable
LM	Local mode seek stop
MENA	Softmute enable
MPAC	Adjacent channel control by multipath
MPF	Multipath filter frequency
MPG	Multipath filter gain
MPOFF	Multipath control "OFF"
MPTH	Multipath threshold
ODCUR	Current for overdeviation-correction
ODSW	Overdeviation-correction enable
OUT	Test output (only for testing)
PC	Counter for PLL (VCO frequency)
PH	I/Q mixer phase adjust
RC	Reference counter PLL
RFAGC	RF AGC
SL	S meter slider
SMCTH	Softmute capacitor threshold for ISS "ON"
SMD	Softmute depth threshold

**Table 7. Control register function (continued)**

Register Name	Function
SMSL	S meter slope
SMTH	Softmute startpoint threshold
TDEV	Time constant for deviation detector
TEST	Testing PLL/IFC (only for testing)
TIN	Switch FSU PIN to TEST input (only for testing)
TINAC	Test input adjacent channel (only for testing)
TINACM	Test input adjacent channel mute (only for testing)
TINMP	Test input multipath(only for testing)
TISS	Time constant for ISS filter "ON"/"OFF"
TOUT	Switch FSU PIN to Test output (only for testing)
TVO	Tuning voltage offset for prestage
TVWB	Tuning voltage offset for prestage (weather band mode)
VCOD	VCO divider
XTAL	Xtal frequency adjust

D1,D2	TOKO KP2311E
D3	TOKO KV1370NT
D4	PHILIPS BB156

Figure 9. Application circuit

## Appendix B Application notes

Following items are important to get highest performance of TDA7512F in application:

1. In order to avoid leakage current from PLL loop filter input to ground a guardring is recommended around loop filter PIN's with PLL reference voltage potential.
2. Distance between Xtal and VCO input PIN 18 should be far as possible and Xtal package should get a shield versus ground.
3. Blocking of VCO supply should be near at PIN 16 and PIN 17.
4. Wire lenght to FM mixer1 input and output should be symetrically and short.
5. FM demodulator capacitance at PIN 44 should be sense connected as short as possible versus demodulator ground at PIN 47.
6. With respect to THD capacitive coupling from PIN 20 to VCO should be avoided. Capacitance at PIN 20 has be connected versus VCC2 ground.

## 7 Revision history

**Please Read Carefully:**

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

**UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.**

**UNLESS EXPRESSLY APPROVED IN WRITING BY AN AUTHORIZED ST REPRESENTATIVE, ST PRODUCTS ARE NOT RECOMMENDED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE. ST PRODUCTS WHICH ARE NOT SPECIFIED AS "AUTOMOTIVE GRADE" MAY ONLY BE USED IN AUTOMOTIVE APPLICATIONS AT USER'S OWN RISK.**

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
