## Precautions

## Correct Use

## Mounting Direction

For a switch with an actuator, mount the switch in a direction where the actuator weight will not be applied to the switch.
Since the switch is designed for a small load, its resetting force is small. Therefore, resetting failure may occur if unnecessary load is applied to the switch.

## Operation

Keep the operation control completely separate from the actuator of the switch, and push it down fully when starting operation. Do not displace the operating position of the actuator when machining.
Consult OMRON in advance if the operating speed is to be extremely slow, or if the pushbutton is to be set somewhere between the free position and operating position.
Mount pin pushbutton switches so that stroke of the pushbutton and the stroke of the operating control overlap on a vertical line. The stroke of the switch, after operation, should be set to 60-90\% that of standard OT (MIN operation).

## Using Microloads

Using a model for ordinary loads to switch microloads may result in faulty operation. Instead, use the models that are designed for microloads and that operate in the following range;

However, even when using microload models within the operating range shown above, if inrush current or inductive voltage spikes occur when the contact is opened or closed, it may increase contact wear and so decrease the service life. Therefore, insert a contact protection circuit where necessary.

## Cautions

## Handling

Be careful not to drop the switch. Doing so may cause damage to the switch's internal components because it is designed for a small load.

## Solder Terminal Connection

Quickly finish the soldering of the lead wire to its terminal. Use a soldering iron rated at 60 W and preferably complete the soldering within 5 seconds.
Excess wattage or prolonged heating can deteriorate the characteristics of the switch.

## Insulation Distance

When mounting, make sure there is sufficient insulation distance between the switch and its mounting panel. If it is insufficient, install an insulation guard or separator. Always install an insulation guard or separator when mounting the microswitch on a metallic body. Contact your OMRON representative for information about insulation guards and separators.

## Application Environment

Do not use the Switch in locations that are subject to toxic gas, silicon, excessive dust, excessive dirt, high temperatures, high humidity, sudden temperature changes, water splashes, or oil splashes.
Otherwise, damage resulting by faulty contact of the Switch contacts, corrosion, or other causes, or other functional faults may occur.
Depending on environmental conditions, the switch should be rechecked about 3 to 6 months after it has been assembled.
