## 32-Channel Vacuum-Fluorescent Display Driver

## Features

- 32 output lines
- 90 V output swing
- Active pull-down
- Latches on all outputs
- Up to $6.0 \mathrm{MHz} @ \mathrm{~V}_{\mathrm{DD}}=5.0 \mathrm{~V}$
- $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ operation

## Applications

- Vacuum flourescent displays
- DC plasma displays

## General Description

The HV518 is designed for vacuum fluorescent or DC plasma applications, where it can serve as a segment, digit or matrix display driver. Each device has 32 outputs, 32 latches and a 32-bit cascadable shift register.

Serial data enters the shift register on the LOW-to-HIGH transition of the clock input. With latch enable ( $\overline{\mathrm{LE}}$ ) HIGH, parallel data is transferred to the output buffers through a 32-bit latch. When $\overline{\mathrm{LE}}$ is low the data is stored in the latch. When STROBE is LOW, all outputs are enabled; if STROBE is HIGH, all outputs are LOW.

## Absolute Maximum Ratings

| Parameter | Value |
| :--- | ---: |
| Supply voltage, $\mathrm{V}_{\mathrm{DD}}$ | -0.5 V to +6.0 V |
| Supply voltage, $\mathrm{V}_{\mathrm{PP}}$ | -0.5 V to +90 V |
| Logic input levels | -0.5 V to $\mathrm{V}_{\mathrm{DD}}+0.5 \mathrm{~V}$ |
| Continuous total power dissipation ${ }^{1,2}$ | 1200 mW |
| Operating temperature | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage temperature | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Soldering temperature ${ }^{3}$ | $260^{\circ} \mathrm{C}$ |

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to GND.

## Notes:

1. Duty cycle is limited by the total power dissipated in the package.
2. For operation above $25^{\circ} \mathrm{C}$ ambient, derate linearly to $85^{\circ} \mathrm{C}$ at $20 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$.
3. Distance of 1.6 mm from case for 10 seconds.

## Power-Up/ Power-Down Sequences

## Power-up sequence should be the following:

1. Connect ground.
2. Apply $\mathrm{V}_{\mathrm{DD}}$.
3. Set all inputs (Data, CLK, Enable, etc.) to a known state.
4. Apply $\mathrm{V}_{\mathrm{PP}}$.

The $V_{P P}$ should not drop below $V_{D D}$ or float during operation.
Power-down sequence should be the reverse of the above.
