# 32-Channel LCD Driver with Separate Backplane Output 

## Features

- HVCMOS® technology
- 32 push-pull CMOS output up to 60 V
- Low power level shifting
- Shift register speed 5.0MHz
- Latched data outputs
- Bidirectional shift register (DIR)
- Backplane output

## General Description

The HV66 is a low voltage serial to high voltage parallel converter with push-pull outputs. This device has been designed for use as a driver circuit for LCD displays. It can also be used in any application requiring multiple output high voltage current sourcing and sinking capabilities. The inputs are fully CMOS compatible.

The device consists of a 32-bit shift register, 32 latches, and control logic to perform blanking and polarity control of the outputs. $\mathrm{HV}_{\text {out }} 1$ is connected to the first stage of the shift register. Data is shifted through the shift register on the logic rising transition of the clock. A DIR pin causes data shifting clockwise when grounded and counter clockwise when connected to VDD. A data output buffer is provided for cascading devices. This output reflects the current status of the last bit of the shift register. Operation of the shift register is not affected by the LE (latch enable), $\overline{B L}$ (blank) or the POL (polarity) inputs. Transfer of data from the shift register to the latch occurs when the LE (latch enable) input is high. The data in the latch is stored after LE transitions from high to low.

Absolute Maximum Ratings ${ }^{1}$

| Parameter | Value |
| :--- | ---: |
| Supply voltage, $\mathrm{V}_{\mathrm{DD}}{ }^{2}$ | -0.5 V to +7.0 V |
| Supply voltage, $\mathrm{V}_{\mathrm{PP}}{ }^{2}$ | -0.5 V to +70 V |
| Logic input levels | -0.5 V to $\mathrm{V}_{\mathrm{DD}}+0.5 \mathrm{~V}$ |
| Ground current $^{3}$ | 1.5 A |
| Continuous total power dissipation $^{4}$ | 1200 mW |
| Operating temperature range | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |
| Storage temperature range | $-65^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Lead temperature <br> $(1.6 m m ~(1 / 16 ~ i n c h) ~ f r o m ~ c a s e ~ f o r ~$ | $260^{\circ} \mathrm{C}$ |

Absolute Maximum Ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. Continuous operation of the device at the absolute rating level may affect device reliability. All voltages are referenced to GND.

## Notes:

1. Device will survive (but operation may not be specified or guaranteed) at these extremes
2. All voltages are referenced to GND
3. Duty cycle is limited by the total power dissipated in the package
4. For operation above $25^{\circ} \mathrm{C}$ ambient derate linearly to $85^{\circ} \mathrm{C}$ at $20 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$

## Power-up sequence should be the following:

1. Connect ground.
2. Apply $V_{D D}$.
3. Set all inputs (Data, CLK, Enable, etc.) to a known state.
4. Apply $\mathrm{V}_{\mathrm{PP}}$.

The $V_{P P}$ should not drop below $V_{D D}$ during operation.
Power-down sequence should be the reverse of the above.
