This new Windows-based PC to I2C communications product makes it easy to work with and develop I2C-based systems. The PC-I2C Board interfaces to the standard Parallel Port on any IBM-compatible PC and allows bi-directional communications with I2C-based peripherals. The PC-I2C software runs on Windows 95 and Windows 98. Using simple menus, the software allows the user to select an I2C peripheral from the list of supported devices.
