

Product Brief – JN5148-EK010

Evaluation Kit

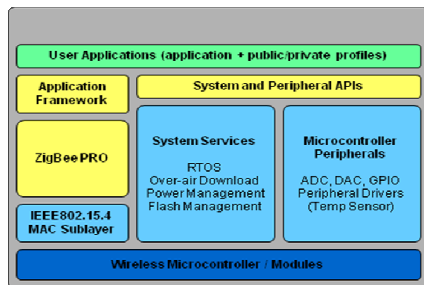

Overview

Jennic's JN5148-EK010 evaluation kit provides a complete environment for the development of JenNet and ZigBee PRO applications based on the JN5148 wireless microcontroller. The kit contains a complete package of hardware and software, including five wireless sensor nodes, an unrestricted software developer kit (SDK), and example code.

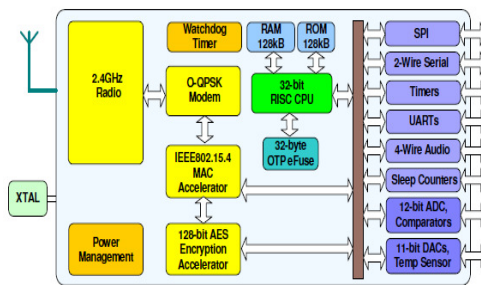

The SDK provides a complete set of development tools, software libraries and APIs (Application Programming Interfaces) for programming and controlling the on-chip peripherals of the JN5148, for configuring and managing the network and for data communication.

Out of the box, the hardware nodes are pre-programmed and demonstrate an example home sensor demo that monitors the state of sensors on the wireless nodes and presents this information on the controller node's LCD display.

Software Architecture

Hardware Architecture

Benefits

- Complete SDK and network stack
- JenNet stack for quick and easy development of proprietary systems
- Stack and hardware “ZigBee Compliant Platform” certified
- Unrestricted development environment – no license fee
- Rapid application development and demonstration
- Application examples
- Profile support with increasing number of supported clusters
- Elliptic Curve Cryptography (ECC) library for Smart Energy security support available from Certicom

Applications

- Smart energy / smart grid: load control and demand response
- Building Automation: HVAC, lighting control, access control, security, fire detection and alarm
- Industrial Automation and Control: pressure, temperature, level sensing, flow control
- Home Control: remote security and surveillance, heating control, lighting control, energy management
- Medical: patient monitoring, asset tagging

Features:

Wireless sensor nodes (5 off)

- JN5148 module
 - 2 x PCB antenna
 - 3 x uFI connected to SMA external antenna
- Onboard temperature, light level and humidity sensors
- JN5148 IO expansion port
- 2 x USB cables
- Battery or external power supply
- 1 node with bitmapped LCD

High power modules (2 off)

- JN5148 high power module for extended range

Software development kit

- GNU-based toolchain - C compiler
- Flash programmer
- Eclipse IDE
- GNU Debugger (GDB) integrated in Eclipse
- Microcontroller and peripheral libraries
- JenNet and ZigBee PRO libraries

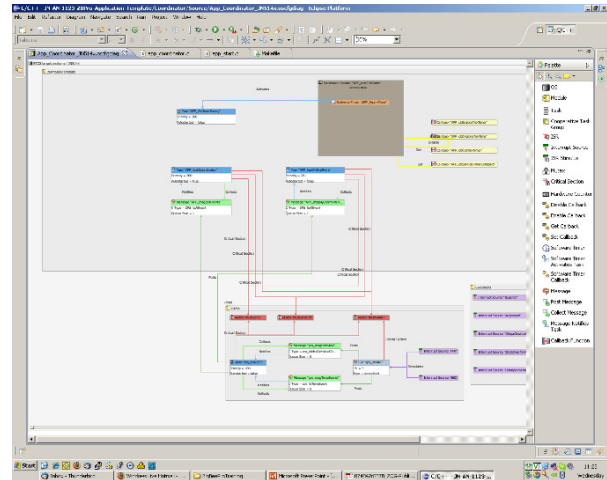

Application support

- User guides, reference manual, datasheets

Software Development

The SDK includes a complete toolchain for rapid application development and debug, including C compiler, assembler, GNU Debugger (GDB) and flash programmer. The toolchain is based upon the industry standard GNU tools running on Windows platforms. The industry standard Eclipse IDE integrates the tool chain, the RTOS and the stack configuration tool into a development environment that offers maximum customisation and collaboration between groups of developers.

Out of the box, the evaluation kit runs a home sensor demo, which measures the light, humidity and temperature levels on the wireless nodes and sends this data back to the network coordinator. In addition there are various application notes with pre-compiled binaries available as download from the Jennic support web page.

Development Hardware

Jennic's JN5148 evaluation kit contains 5 battery powered wireless nodes. Each node contains temperature, humidity and light-level sensors and features Jennic's JN5148 wireless microcontroller implemented on a compact reference module.

An expansion port enables connection of additional sensors and controls to the wireless microcontroller and its peripherals. Programming of the flash memory and/or serial communications with the wireless nodes is achieved by the connection of a USB cable provided with the kit. One wireless node contains a 128x64 bitmapped LCD. For range testing and module evaluation, two high power modules with a maximum output of 20dbm are included in the kit.

Hardware Debugging

The JN5148 can support hardware debugging through the on board JTAG port and a suitable JTAG debugger (not included in the kit). For details of suitable recommended JTAG debuggers and an application note that describes how to use these with Eclipse/GDB, please visit Jennic's website.
