XRT75R12 TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER

Experience *Our* Connectivity...

GENERAL DESCRIPTION

The XRT75R12 is a twelve channel fully integrated Line Interface Unit (LIU) featuring EXAR's R³ Technology (Reconfigurable, Relayless Redundancy) for E3/DS3/STS-1 applications. The LIU incorporates 12 independent Receivers, Transmitters and Jitter Attenuators in a single 420 Lead TBGA package.

Each channel of the XRT75R12 can be independently configured to operate in E3 (34.368 MHz), DS3 (44.736 MHz) or STS-1 (51.84 MHz). Each transmitter can be turned off and tri-stated for redundancy support or for conserving power.

The XRT75R12's differential receiver provides high noise interference margin and is able to receive data over 1000 feet of cable or with up to 12 dB of cable attenuation.

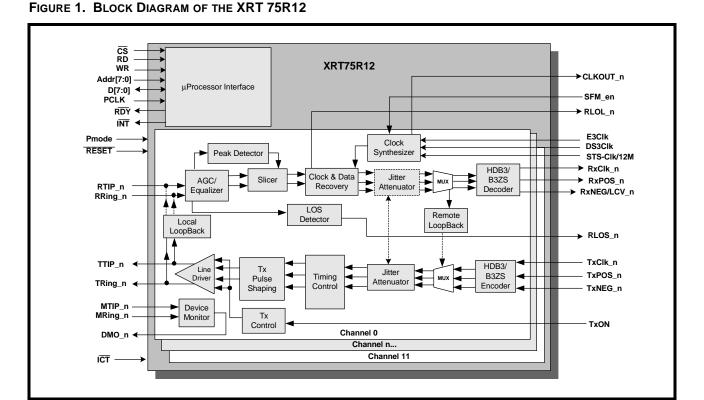

The XRT75R12 incorporates an advanced crystalless jitter attenuator per channel that can be selected either in the transmit or receive path. The jitter attenuator performance meets the ETSI TBR-24 and Bellcore GR-499 specifications.

The XRT75R12 provides a Parallel Microprocessor Interface for programming and control.

The XRT75R12 supports analog, remote and digital loop-backs. The device also has a built-in Pseudo Random Binary Sequence (PRBS) generator and detector with the ability to insert and detect single bit error for diagnostic purposes.

APPLICATIONS

- E3/DS3 Access Equipment
- DSLAMs
- Digital Cross Connect Systems
- CSU/DSU Equipment
- Routers
- Fiber Optic Terminals

ORDERING INFORMATION

PART NUMBER	Package	OPERATING TEMPERATURE RANGE
XRT75R12IB	420 Lead TBGA	-40°C to +85°C

Exar Corporation 48720 Kato Road, Fremont CA, 94538 • (510) 668-7000 • FAX (510) 668-7017 • www.exar.com

FEATURES

RECEIVER

- R³ Technology (Reconfigurable, Relayless Redundancy)
- On chip Clock and Data Recovery circuit for high input jitter tolerance
- Meets E3/DS3/STS-1 Jitter Tolerance Requirement
- Detects and Clears LOS as per G.775
- · Receiver Monitor mode handles up to 20 dB flat loss with 6 dB cable attenuation
- On chip B3ZS/HDB3 encoder and decoder that can be either enabled or disabled
- On-chip clock synthesizer provides the appropriate rate clock from a single 12.288 MHz Clock
- Provides low jitter output clock

TRANSMITTER

- R³ Technology (Reconfigurable, Relayless Redundancy)
- Compliant with Bellcore GR-499, GR-253 and ANSI T1.102 Specification for transmit pulse
- Tri-state Transmit output capability for redundancy applications
- Each Transmitter can be independently turned on or off
- Transmitters provide Voltage Output Drive

JITTER ATTENUATOR

- · On chip advanced crystal-less Jitter Attenuator for each channel
- Jitter Attenuator can be selected in Receive, Transmit path, or disabled
- Meets ETSI TBR 24 Jitter Transfer Requirements
- · Compliant with jitter transfer template outlined in ITU G.751, G.752, G.755 and GR-499-CORE,1995 standards
- 16 or 32 bits selectable FIFO size

CONTROL AND DIAGNOSTICS

- Parallel Microprocessor Interface for control and configuration
- Supports optional driver internal Transmit monitoring

- Each channel supports Analog, Remote and Digital Loop-backs
- Single 3.3 V ± 5% power supply
- 5 V Tolerant digital inputs
- Available in 420 pin TBGA Thermally enhanced Package
- 40℃ to 85℃ Industrial Temperature Range

TRANSMIT INTERFACE CHARACTERISTICS

- Accepts either Single-Rail or Dual-Rail data from Terminal Equipment and generates a bipolar signal to the line
- Integrated Pulse Shaping Circuit
- Built-in B3ZS/HDB3 Encoder (which can be disabled)
- Accepts Transmit Clock with duty cycle of 30%-70%
- Generates pulses that comply with the ITU-T G.703 pulse template for E3 applications
- Generates pulses that comply with the DSX-3 pulse template, as specified in Bellcore GR-499-CORE and ANSI T1.102_1993
- Generates pulses that comply with the STSX-1 pulse template, as specified in Bellcore GR-253-CORE
- Transmitter can be turned off in order to support redundancy designs

RECEIVE INTERFACE CHARACTERISTICS

- Integrated Adaptive Receive Equalization (optional) for optimal Clock and Data Recovery
- Declares and Clears the LOS defect per ITU-T G.775 requirements for E3 and DS3 applications
- Meets Jitter Tolerance Requirements, as specified in ITU-T G.823_1993 for E3 Applications
- Meets Jitter Tolerance Requirements, as specified in Bellcore GR-499-CORE for DS3 Applications
- Declares Loss of Lock (LOL) Alarm
- Built-in B3ZS/HDB3 Decoder (which can be disabled)
- Recovered Data can be muted while the LOS Condition is declared
- Outputs either Single-Rail or Dual-Rail data to the **Terminal Equipment**

PIN DESCRIPTIONS (BY FUNCTION)

SYSTEM-SIDE TRANSMIT INPUT AND TRANSMIT CONTROL PINS

Pin #	SIGNAL NAME	Түре	DESCRIPTION
P4	TxON	I	Transmit On/Off InputUpon power up, the transmitters are powered on. Turning the transmittersOn or Off is selected through the microprocessor interface by programmingthe appropriate channel register if this pin is pulled "High". If the TxON pinis pulled "Low", all 12 transmitters are powered off.Note: TxON is ideal for redundancy applications. See the R ³ Technologysection of this datasheet for more details. Internally pulled "High".
F22 AA22 H22 Y23 G26 AA25 G1 AA2 H5 Y4 F5 AA5	TxCLK0 TxCLK1 TxCLK2 TxCLK3 TxCLK4 TxCLK5 TxCLK6 TxCLK7 TxCLK8 TxCLK9 TxCLK10 TxCLK11	Ι	 Transmit Clock Input These input pins have three functions: They function as the timing source for the Transmit Section of the corresponding channel within the XRT75R12. They are used by the Transmit Section of the LIU IC to sample the corresponding TxPOS_n and TxNEG_n input pins. They are used to clock the PRBS generator Note: The user is expected to supply a 44.736MHz ± 20ppm clock signal (for DS3 applications), 34.368MHz ± 20 ppm clock signal (for E3 applications) or a 51.84MHz ± 4.6ppm clock signal (for STS-1, Stratum 3E or better applications).
E23 AB24 J22 AA23 G25 AA26 G2 AA1 J5 AA4 E4 AB3	TxPOS0 TxPOS1 TxPOS2 TxPOS3 TxPOS4 TxPOS5 TxPOS6 TxPOS7 TxPOS8 TxPOS9 TxPOS10 TxPOS11	1	 Transmit Positive Data Input The function of these digitial input pins depends upon whether the corresponding channel has been configured to operate in the Single-Rail or Dual-Rail Mode. Single Rail Mode - Transmit Data Input Operating in the Single-Rail Mode; all transmit input data will be serially applied to this input pin. This signal will be latched into the Transmit Section circuitry on the active edge of the TxCLK_n signal. The Transmit Section of the LIU IC will then encode this data into either the B3ZS line code (for DS3 and STS-1 applications) or the HDB3 line code (for E3 applications). Dual Rail Mode - Transmit Positive Data Input In the Dual-Rail Mode, the user should apply a pulse to this input pin when a positive-polarity pulse is to be transmitted onto the line. This signal will be latched into the Transmit Section circuitry upon the active edge of the TxCLK_n signal. The Transmit Section of the LIU IC will NOT encode this data into either the B3ZS or HDB3 line codes. If the user configures the LIU IC to operate in the Dual-Rail Mode, B3ZS/HDB3 encoding must have already been done prior to this input.

SYSTEM-SIDE TRANSMIT INPUT AND TRANSMIT CONTROL PINS

PIN #	SIGNAL NAME	Түре	DESCRIPTION
C25	TxNEG0	I	Transmit Negative Data Input
AB25	TxNEG1		When a Channel has been configured to operate in the Dual-Rail Mode,
H23	TxNEG2		the user should apply a pulse to this input pin anytime the Transmit Section
W23	TxNEG3		of the LIU IC to generate a negative-polarity pulse onto the line. This signal
H24	TxNEG4		will be latched into the Transmit Section circuitry upon the active edge of
Y26	TxNEG5		the TxCLK_n signal.
H3	TxNEG6		NOTE: In the Single-Rail Mode, this input pin has no function, and should be tied to GND.
Y1	TxNEG7		be lieu to GND.
H4	TxNEG8		
W4	TxNEG9		
C2	TxNEG10		
AB2	TxNEG11		
B24	TTip0	0	Transmit TTIP Output - Positive Polarity Signal
AE24	TTip1		These output pins along with the corresponding TRING_n output pins,
C20	TTip2		function as the Transmit DS3/E3/STS-1 Line output signal drivers for a
AD20	TTip3		given channel of the XRT75R12.
C16	TTip4		Connect this signal and the corresponding TRING_n output signal to a 1:1
AD16	TTip5		transformer.
C11	TTip6		Whenever the Transmit Section of the Channel generates and transmits a positive-polarity pulse onto the line, this output pin will be pulsed to a high
AD11	TTip7		ervoltage than its corresponding TRING_n output pins.
C7	TTip8		Conversely, whenever the Transmit Section of the Channel generates and
AD7	TTip9		transmit a negative-polarity pulse onto the line, this output pin will be
C3	TTip10		pulsed to a lower voltage than its corresponding TRING_n output pin.
AD3	TTip11		NOTE: This output pin will be tri-stated whenever the TxON input pin or bit-
			field is set to "0".
C24	TRing0	0	Transmit Ring Output - Negative Polarity Signal
AD24	TRing1		These output pins along with the corresponding TTIP_n output pins, func-
B20	TRing2		tion as the Transmit DS3/E3/STS-1 Line output signal drivers for a given
AE20	TRing3		channel, within the XRT75R12.
B16	TRing4		Connect this signal and the corresponding TTIP_n output signal to a 1:1 transformer.
AE16	TRing5		Whenever the Transmit Section of the Channel generates and transmits a
B11	TRing6		positive-polarity pulse onto the line, this output pin will be pulsed to a lower
AE11	TRing7		voltage than its corresponding TTIP_n output pin.
B7	TRing8		Conversely, whenever the Transmit Section of the Channel generates and
AE7	TRing9		transmit a negative-polarity pulse onto the line, this output pin will be
B3	TRing10		pulsed to a higher voltage than its corresponding TTIP_n output pin.
AE3	TRing11		Note: This output pin will be tri-stated whenever the TxON input pin or bit-field is set to "0".

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

SYSTEM-SIDE TRANSMIT INPUT AND TRANSMIT CONTROL PINS

PIN #	SIGNAL NAME	Түре	DESCRIPTION
C23 AD23 D19 AC19 D15 AC15 E11 AB11 E8 AB8 C4 AD4	MTip0 MTip1 MTip2 MTip3 MTip4 MTip5 MTip6 MTip7 MTip8 MTip9 MTip10 MTip11	I	 Monitor Tip Input - Positive Polarity Signal These input pins along with MRing_n function as the Transmit Drive Monitor Output (DMO) input monitoring pins. (1) To monitor the Transmit Output line signal and (2) to perform this monitoring externally, then this pin MUST be connected to the corresponding TTIP_n output pin via a 270Ω series resistor. Similarly, the MRING_n input pin MUST also be connected to its corresponding TRING_n output pin via a 270Ω series resistor. The MTIP_n and MRING_n input pins will continuously monitor the Transmit Output line signal via the TTIP_n and TRING_n output pins for bipolar activity. If these pins do not detect any bipolar activity for 128 bit periods, then the Transmit Drive Monitor circuit will drive the corresponding DMO_n output pin "High" in order to denote a possible fault condition in the Transmit Output Line signal path. Note: These input pins are inactive if the user chooses to internally monitor the Transmit Output line signal.
D23 AC23 E19 AB19 E16 AB16 D10 AC10 D8 AC8 D4 AC4	MRing0 MRing1 MRing2 MRing3 MRing4 MRing5 MRing6 MRing7 MRing8 MRing9 MRing10 MRing11	I	 Monitor Ring Input These input pins along with MTIP_n function as the Transmit Drive Monitor Output (DMO) input monitoring pins. (1) To monitor the Transmit Output line signal and (2) to perform this monitoring externally, then this input pin MUST be connected to the corresponding TRING_n output pin via a 270Ω series resistor. Similarly, the MTIP_n input pin MUST be connected to its corresponding TTIP_n output pin via a 270Ω series resistor. The MTIP_n and MRING_n input pins will continuously monitor the Transmit Output line signal via the TTIP_n and TRING_n output pins for bipolar activity. If these pins do not detect any bipolar activity for 128 bit periods, then the Transmit Drive Monitor circuit will drive the corresponding DMO_n output pin "High" to indicate a possible fault condition in the Transmit Output Line signal path. Note: These input pins are inactive if the user chooses to internally monitor the Transmit Output line signal.
N3 N4 N5 N1 L2 M2 M3 M4 M5 K2 J1	DMO0 DMO1 DMO2 DMO3 DMO4 DMO5 DMO6 DMO7 DMO8 DMO9 DMO10 DMO11	0	Drive Monitor Output These output signals are used to indicate a fault condition within the Trans- mit Output signal path. This output pin will toggle "High" anytime the Transmit Drive Monitor cir- cuitry either, via the corresponding MTIP and MRING input pins or inter- nally, detects no bipolar pulses via the Transmit Output line signal (e.g., via the TTIP_m and TRING_m output pins) for 128 bit-periods. This output pin will be driven "Low" anytime the Transmit Drive Monitor cir- cuitry has detected at least one bipolar pulse via the Transmit Output line signal within the last 128 bit periods.

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

SYSTEM-SIDE RECEIVE OUTPUT AND RECEIVE CONTROL PINS

PIN #	SIGNAL NAME	Түре	DESCRIPTION
D25	RLOS0	0	Receive Loss of Signal Output Indicator
AD25	RLOS1		This output pin indicates Loss of Signal (LOS) Defect condition for the corre-
G23	RLOS2		sponding channel.
AA24	RLOS3		"Low" - Indicates that the corresponding Channel is NOT currently declaring the
J24	RLOS4		LOS defect condition.
U24	RLOS5		"High" - Indicates that the corresponding Channel is currently declaring the LOS
J3	RLOS6		defect condition.
U3	RLOS7		
G4	RLOS8		
AA3	RLOS9		
D2	RLOS10		
AD2	RLOS11		
G22	RLOL0	0	Receive Loss of Lock Output Indicator
AB26	RLOL1		This output pin indicates Loss of Lock (LOL) condition for the corresponding
K22	RLOL2		channel.
U22	RLOL3		"Low" - Indicates that the corresponding Channel is NOT declaring the LOL
L24	RLOL4		condition.
W25	RLOL5		"High" - Indicates that the corresponding Channel is currently declaring the LOL condition.
L3	RLOL6		
W2	RLOL7		Note: The Receive Section of a given channel will declare the LOL condition anytime the frequency of the Recovered Clock (RCLK) signal differs
K5	RLOL8		from that of the reference clock programmed for that channel by 0.5%
U5	RLOL9		or more.
G5	RLOL10		
AB1	RLOL11		
E25	RxPOS0	0	Receive Positive Data Output
AD26	RxPOS1		The function of these output pins depends upon whether the channel has been
G24	RxPOS2		configured to operate in the Single-Rail or Dual-Rail Mode.
Y24	RxPOS3		Dual-Rail Mode - Receive Positive Polarity Data Output
L22	RxPOS4		If the channel has been configured to operate in the Dual-Rail Mode, then all positive-polarity data will be output via this pin. The negative-polarity data will
T22	RxPOS5		be output via the corresponding RxNEG_n pin. In other words, the Receive
L5	RxPOS6		Section of the corresponding Channel will pulse this output pin "High" for one
T5	RxPOS7		period of RCLK_n anytime it receives a positive-polarity pulse via the RTIP/
G3	RxPOS8		RRING input pins.
Y3	RxPOS9		The data output via this pin is updated upon the active edge of RxCLK_n output
E2	RxPOS10		clock signal.
AD1	RxPOS11		Single-Rail Mode - Receive Data Output
			In the Single-Rail Mode, all Receive (or Recovered) data will be output via this pin.
			The data output via this pin is updated upon the active edge of RxCLK_n output clock signal.

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

SYSTEM-SIDE RECEIVE OUTPUT AND RECEIVE CONTROL PINS

Pin #	SIGNAL NAME	Түре	DESCRIPTION
Pin # F23 AC26 F24 U23 L23 T24 L4 T3 F3 U4 F4 AC1	SIGNAL NAME RXNEG/LCV0 RXNEG/LCV1 RXNEG/LCV2 RXNEG/LCV3 RXNEG/LCV4 RXNEG/LCV5 RXNEG/LCV6 RXNEG/LCV7 RXNEG/LCV7 RXNEG/LCV9 RXNEG/LCV10 RXNEG/LCV11	Түре О	 Receive Negative Data Output/Line Code Violation The function of these pins depends on whether the XRT75R12 is configured in Single Rail or Dual Rail mode. Dual-Rail Mode - Receive Negative Polarity Data Output In the Dual-Rail Mode, all negative-polarity data will be output via this pin. The positive-polarity data will be output via the corresponding RxPOS_n output pin. In other words, the Receive Section of the corresponding Channel will pulse this output pin "High" for one period of RxCLK_n anytime it receives a negative-polarity pulse via the RTIP/RRING input pins. The data output via this pin is updated upon the active edge of the RCLK_n output clock signal. Single-Rail Mode - Line Code Violation Indicator Output In the Single-Rail Mode, this output pin will function as the Line Code Violation indicator output. In this configuration, the Receive Section of the Channel will pulse this output
E24 AC25 J23 V23 K24 T23 K3 T4 J4 V4 E3 AC2	RxCLK0 RxCLK1 RxCLK2 RxCLK3 RxCLK4 RxCLK5 RxCLK6 RxCLK6 RxCLK7 RxCLK8 RxCLK9 RxCLK10 RxCLK11	Ο	pin "High" for at least one RCLK period whenever it detects either an LCV (Line Code Violation) or an EXZ (Excessive Zero Event). The data that is output via this pin is updated upon the active edge of the RCLK_n output clock signal. Receive Clock Output This output pin functions as the Receive or recovered clock signal. All Receive (or recovered) data will output via the RxPOS_n and RxNEG_n outputs upon the active edge of this clock signal. Additionally, if the device/channel has been configured to operate in the Single- Rail Mode, then the RNEG_n/LCV_n output pins will also be updated upon the active edge of this clock signal.

RECEIVE LINE SIDE PINS

Pin #	SIGNAL NAME	Түре	DESCRIPTION
B22	RTip0	I	Receive TIP Input
AE22	RTip1		These input pins along with the corresponding RRing_n input pin function as the
B18	RTip2		Receive DS3/E3/STS-1 Line input signal for a given channel of the XRT75R12.
AE18	RTip3		Cconnect this signal and the corresponding RRING_n input signal to a 1:1
A14	RTip4		transformer.
AF14	RTip5		Whenever the RTIP/RRING input pins are receiving a positive-polarity pulse
D13	RTip6		within the incoming DS3, E3 or STS-1 line signal, this input pin will be pulsed to a higher voltage than its corresponding RRING_n input pin.
AC13	RTip7		Conversely, whenever the RTIP/RRING input pins are receiving a negative-
B9	RTip8		polarity pulse within the incoming DS3, E3 or STS-1 line signal, this input pin
AE9	RTip9		will be pulsed to a lower voltage than its corresponding RRING_n input pin.
B5	RTip10		
AE5	RTip11		
C22	RRing0	I	Receive Ring Input
AD22	RRing1		These input pins along with the corresponding RTIP_n input pin function as the
C18	RRing2		Receive DS3/E3/STS-1 Line input signal for a given channel of the XRT75R12.
AD18	RRing3		Connect this signal and the corresponding RTIP_n input signal to a 1:1 trans-
B14	RRing4		former. (See Figure 6)
AE14	RRing5		Whenever the RTIP/RRING input pins are receiving a positive-polarity pulse
C13	RRing6		within the incoming DS3, E3 or STS-1 line signal, then this input pin will be pulsed to a lower voltage than its corresponding RTIP_n input pin.
AD13	RRing7		Conversely, whenever the RTIP/RRING input pins are receiving a negative-
C9	RRing8		polarity pulse within the incoming DS3, E3 or STS-1 line signal, then this input
AD9	RRing9		pin will be pulsed to a higher voltage than its corresponding RTIP_n input pin.
C5	RRing10		
AD5	RRing11		

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

CLOCK INTERFACE

Pin #	SIGNAL NAME	Түре	DESCRIPTION
R5	SFM_EN	I	Single Frequency Mode Enable This input pin is used to configure the XRT75R12 to operate in the SFM (Single Frequency Mode). When this feature is invoked, the SFM Synthesizer will become active. By applying a 12.288MHz clock signal to the STS-1Clk/12M pin, the XRT75R12 will generate all of the appropriate clock signals (e.g., 34.368MHz, 44.736MHz or 51.84). The XRT75R12 internal circuitry will route each of these synthesized clock signals to the appropriate nodes of the corresponding channels in the XRT75R12. "Low" - Disables the Single Frequency Mode. In this setting, the user is required to supply to the E3CLK, DS3CLK or STS-1CLK input pins all of the rel- evant clock signals that are to be used within the chip. "High" - Enables the Single-Frequency Mode. <i>Note: This input pin is internally pulled low.</i>
R1	E3Clk	I	E3 Clock Input (34.368 MHz ± 20 ppm) If any one of the channels is configured in E3 mode, a reference clock of 34.368 MHz ± 20 ppm is applied to this input pin. If the LIU is used in E3 mode only, this pin must be connected to the DS3Clk input pin to have access to the inter- nal microprocessor. Note: SFM mode negates the need for this clock
T1	DS3Clk	I	DS3 Clock Input (44.736 MHz ± 20 ppm) If any one of the channels is configured in DS3 mode, a reference clock of 44.736 MHz ± 20 ppm is applied to this input pin. <i>Note: SFM mode negates the need for this clock</i>
U1	STS-1Clk/12M	I	 STS-1 Clock Input (51.84 MHz ± 20 ppm) If any one of the channels is configured in STS-1 mode, a reference clock of 51.84MHz ± 20 ppm is applied to this input pin. If the LIU is used in STS-1 mode only, this pin must be connected to the DS3Clk input pin to have access to the internal microprocessor. Single Frequency Mode Clock Input (12.288MHz ± 20 ppm) In Single Frequency Mode, a reference clock of 12.288 MHz ± 20 ppm is connected to this pin and the internal clock synthesizer generates the appropriate clock frequencies based on the configuration of the rates (E3, DS3 or STS-1).
C26 W22 K23 W24 J25 V25 J2 V2 K4 W3 C1 W5	CLKOUT0 CLKOUT1 CLKOUT2 CLKOUT3 CLKOUT4 CLKOUT5 CLKOUT6 CLKOUT7 CLKOUT8 CLKOUT9 CLKOUT10 CLKOUT11	0	Reference Clock Out A reference clock pin is provided for each channel that will supply a precise data rate frequency derived from either the Clock input pin (E3Clk, DS3Clk, or STS- 1Clk) or the 12.288MHz input in SFM mode. This frequency will be as stable as the original source. It is designed to provide the attached framer with its appro- priate reference clock.

GENERAL CONTROL PINS

PIN #	SIGNAL NAME	Түре	DESCRIPTION
P3	TEST	****	Factory Test Mode Input Pin This pin must be connected to GND for normal operation. Note: This input pin is internally pulled "Low".
AE25	TRST	I	Test Reset Test Boundary Scan
AB23	TMS	Ι	Test Mode Select Test Boundary Scan
AB5	TCK	I	Test Clock Test Boundary Scan
AB4	TDI	Ι	Test Data Input Test Boundary Scan
AE2	TDO	0	Test Data Output Test Boundary Scan

MICROPROCESSOR PARALLEL INTERFACE -

Pin #	SIGNAL NAME	Түре	DESCRIPTION
J26	Pmode	I	This pin controls the Microprocessor Parallel Interface mode.
			"High" sets a Synchronous clocked interface mode with a clock from the Host.
			"Low" sets an Asynchronous mode where a clock internal to the XRT75R12 will time the operations.
P24	PCLK	I	High speed clock supplied by the Host to provide timing in the Synchronous Interface mode. This signal must be a square-wave.
N24	CS	I	Chip Select Input (active low)
			Initiates a read or write operation. When "High", no parallel communication is active between the LIU and the Host.
N22	WR	I	Write Input (active low)
			Enables the Host to write data D[7:0] into the LIU register space at address Addr[7:0].
N23	RD	I	Read Input (active low)
			Commands the LIU to transfer the contents of a register specified by Addr[7:0] to the Host.
N25	RDY	0	Ready Line Output (active low)
			Provides a handshake between the LIU and the Host that communicates when an operation has been completed.
			Note: This pin must be pulled "High" with a $3k\Omega \pm 1\%$ resistor.

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

MICROPROCESSOR PARALLEL INTERFACE -

PIN #	SIGNAL NAME	Түре	DESCRIPTION
K25	Addr0	I	An eight bit direct address bus that specifies the source/destination register for a
M22	Addr1		Read or Write operation.
M23	Addr2		
M24	Addr3		
K26	Addr4		
L26	Addr5		
M26	Addr6		
N26	Addr7		
P22	D0	I/O	An eight bit bi-directional data bus that provides the data into the LIU for a Write
R26	D1		operation or the data out to the Host for a Read operation.
T26	D2		
U26	D3		
R25	D4		
R24	D5		
R23	D6		
R22	D7		
P26	INT	0	Interrupt Active Output (active low)
			Normally, this output pin will be pulled "High". However, if the user enables interrupts within the LIU, and if those conditions occur, the XRT75R12 will signal an interrupt from the Microprocessor by pulling this output pin "Low". The Host Microprocessor must ascertain the source of the interrupt and service it. Reading the source of the interrupt will clear the flag and the INT pin will go back high unless another interrupt has gone active.
			Notes:
			1. This pin will remain "Low" until the Interrupt has been serviced.
			2. This pin must be pulled "High" with a $3k\Omega \pm 1\%$ resistor.
N2	RESET	I	RESET Input Pulsing this input "Low" causes the XRT75R12 to reset the contents of the on- chip Command Registers to their default values. As a consequence, the XRT75R12 will then also be operating in its default condition. For normal operation this input pin should be at a logic "High". Note: This input pin is internally pulled high.

POWER SUPPLY PINS

PIN NAME	PIN NUMBERS	DESCRIPTION
RVDD0 RVDD1 RVDD2 RVDD3 RVDD4 RVDD5 RVDD6 RVDD6 RVDD7 RVDD8 RVDD9 RVDD9 RVDD10 RVDD11	D22 AC22 D18 AC18 E15 AB15 E12 AB12 A9 AF9 D5 AC5	Receive Analog Power Supply (3.3V ±5%) RVDD should not be shared with other power supplies. It is recommended that RVDD be isolated from the digital power supply DVDD and the analog power supply TVDD. For best results, use an internal power plane for isola- tion. If an internal power plane is not available, a ferrite bead can be used. Each power supply pin should be bypassed to ground through an external 0.1μ F capacitor.
TVDD0 TVDD1 TVDD2 TVDD3 TVDD4 TVDD5 TVDD6 TVDD6 TVDD7 TVDD8 TVDD9 TVDD9 TVDD10 TVDD11	B23 AE23 B19 AE19 B15 AE15 B10 AE10 A6 AF6 B4 AE4	Transmit Analog Power Supply (3.3V \pm 5%) TVDD can be shared with DVDD. However, it is recommended that TVDD be isolated from the analog power supply RVDD. For best results, use an inter- nal power plane for isolation. If an internal power plane is not available, a fer- rite bead can be used. Each power supply pin should be bypassed to ground through an external 0.1µF capacitor.
AVDD	M25, T25, AB21, AB18, AF13, AF12, AB9, AB6, R4, K1, E6, E9, A12, A13, E18, E21,	Analog Power Supply $(3.3V \pm 5\%)$ AVDD should be isolated from the digital power supplies. For best results, use an internal power plane for isolation. If an internal power plane is not available, a ferrite bead can be used. Each power supply pin should be bypassed to ground through at least one 0.1μ F capacitor.
DVDD	D26, F25, H25, P25, W26, V24, Y22, AF21, AF20, AF17, AF16, AD14, AD12, AF11, AF8, AF7, AF24, AD6, AF3, Y5, V3, W1, P5, P2, H2, F2, D1, C6, A7, A3, A8, A11, C12, C14, A16, A17, A20, A21, A24	Digital Power Supply (3.3V ±5%) DVDD should be isolated from the analog power supplies. For best results, use an internal power plane for isolation. If an internal power plane is not available, a ferrite bead can be used. Every two DVDD power supply pins should be bypassed to ground through at least one 0.1μ F capacitor.

REV. 1.0.4

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

FUNCTIONAL DESCRIPTION

The XRT75R12 is a twelve channel fully integrated Line Interface Unit featuring EXAR's R³ Technology (Reconfigurable, Relayless Redundancy) for E3/DS3/STS-1 applications. The LIU incorporates 12 independent Receivers, Transmitters and Jitter Attenuators in a single 420 Lead TBGA package. Each channel can be independently programmed to support E3, DS-3 or STS-1 line rates using one input clock reference of 12.288MHz in Single Frequency Mode (SFM). The LIU is responsible for providing the physical connection between a line interface and an aggregate mapper or framing device. Along with the analog-to-digital processing, the LIU offers monitoring and diagnostic features to help optimize network design implementation. A key characteristic within the network topology is Automatic Protection Switching (APS). EXAR's proven expertise in providing redundany solutions has paved the way for R³ Technology.

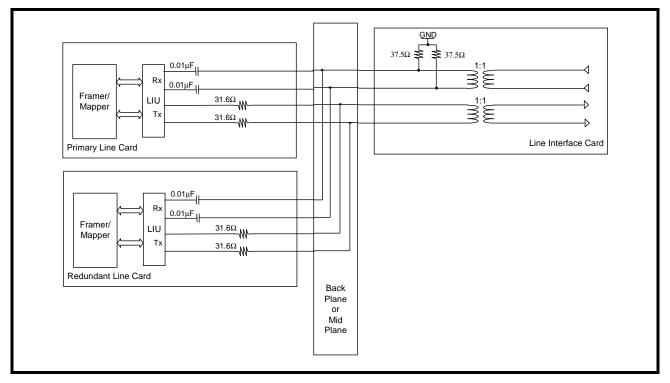

1.0 R³ TECHNOLOGY (RECONFIGURABLE, RELAYLESS REDUNDANCY)

Redundancy is used to introduce reliability and protection into network card design. The redundant card in many cases is an exact replicate of the primary card, such that when a failure occurs the network processor can automatically switch to the backup card. EXAR's R³ technology has re-defined E3/DS-3/STS-1 LIU design for 1:1 and 1+1 redundancy applications. Without relays and one Bill of Materials, EXAR offers multi-port, integrated LIU solutions to assist high density aggregate applications and framing requirements with reliability. The following section can be used as a reference for implementing R³ Technology with EXAR's world leading line interface units.

1.1 Network Architecture

A common network design that supports 1:1 or 1+1 redundancy consists of N primary cards along with N backup cards that connect into a mid-plane or back-plane architecture without transformers installed on the network cards. In addition to the network cards, the design has a line interface card with one source of transformers, connectors, and protection components that are common to both network cards. With this design, the bill of materials is reduced to the fewest amount of components. See Figure 2. for a simplified block diagram of a typical redundancy design.

FIGURE 2. NETWORK REDUNDANCY ARCHITECTURE

2.0 CLOCK SYNTHESIZER

The LIU uses a flexible user interface for accepting clock references to generate the internal master clocks used to drive the LIU. The reference clock used to supply the microprocessor timing is generated from the DS-3 or SFM clock input. Therefore, if the chip is configured for STS-1 only or E3 only, then the DS-3 input pin must be connected to the STS-1 pin or E3 pin respectively. In DS-3 mode or when SFM is used, the STS-1 and E3 input pins can be left unconnected. If SFM is enabled by pulling the SFM_EN pin "High", 12.288MHz is the only clock reference necessary to generate DS-3, E3, or STS-1 line rates and the microprocessor timing. A simplified block diagram of the clock synthesizer is shown in Figure 3. Reference clock performance specifications can be found on Table 2 below.

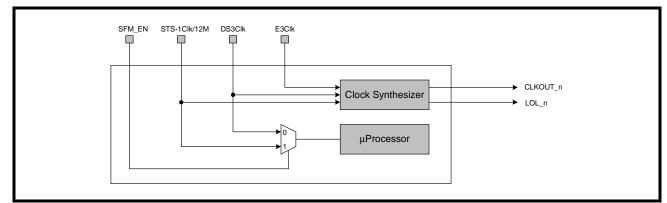

FIGURE 3. SIMPLIFIED BLOCK DIAGRAM OF THE INPUT CLOCK CIRCUITRY DRIVING THE MICROPROCESSOR

TABLE 2: REFERENCE CLOCK PERFORMANCE SPECIFICATIONS

SYMBOL	PARAMETER	Min	Түр	ΜΑΧ	Units
REF _{DUTY}	Reference Clock Duty Cycle	40		60	%
REF _{E3}	E3 Reference Clock Frequency Tolerance ¹	-20		+20	ppm
REF _{DS3}	DS3 Reference Clock Frequency Tolerance ¹	-20		+20	ppm
REF _{STS1}	STS-1 Reference Clock Frequency Tolerance ¹	-20		+20	ppm
REF _{SFM}	SFM Reference Clock Frequency Tolerance ¹	-20		+20	ppm
t _{RISE_REFCLK}	Reference Clock Rise Time (10% to 90%)			5	ns
t _{FALL_REFCLK}	Reference Clock Fall Time (90% to 10%)			5	ns
CLK _{JIT}	Reference Clock Jitter Stability ²			0.005	UI _{p2p}

Notes:

- 1. Required to meet Bellcore GR-499 specification on frequency stability requirements. However, the LIU can functionally operate with ±100 ppm without meeting the required specifications.
- 2. Reference clock jitter limits are required for the transmit output to meet ITU-T and Bellcore system level jitter requirements.

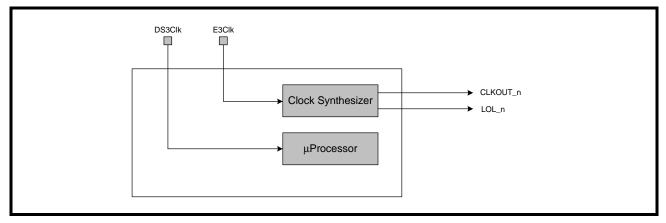

Experience Our Connectivity.

REV. 1.0.4 TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

2.1 Clock Distribution

Network cards that are designed to support multiple line rates which are not configured for single frequency mode should ensure that a clock is applied to the DS3Clk input pin. For example: If the network card being supplied to an ISP requires E3 only, the DS-3 input clock reference is still necessary to provide read and write access to the internal microprocessor. Therefore, the E3 mode requires two input clock references. If however, multiple line rates will not be supported, i.e. E3 only, then the DS3Clk input pin may be hard wire connected to the E3Clk input pin.

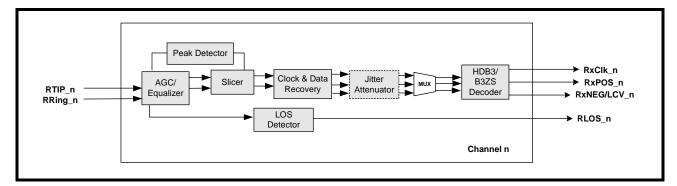

NOTE: For one input clock reference, the single frequency mode should be used.

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

3.0 THE RECEIVER SECTION

The receiver is designed so that the LIU can recover clock and data from an attenuated line signal caused by cable loss or flat loss according to industry specifications. Once data is recovered, it is processed and presented at the receiver outputs according to the format chosen to interface with a Framer/Mapper or ASIC. This section describes the detailed operation of various blocks within the receive path. A simplified block diagram of the receive path is shown in Figure 5.

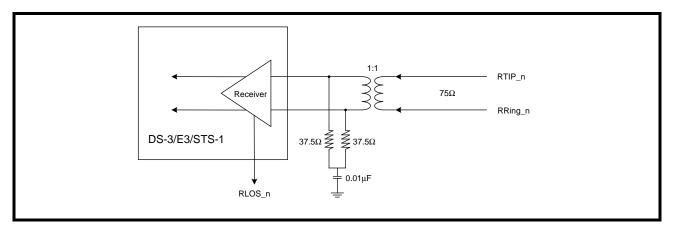

3.1 Receive Line Interface

Physical Layer devices are AC coupled to a line interface through a 1:1 transformer. The transformer provides isolation and a level shift by blocking the DC offset of the incoming data stream. The typical medium for the line interface is a 75Ω coxial cable. Whether using E3, DS-3 or STS-1, the LIU requires the same bill of materials, see Figure 6.

3.2 Adaptive Gain Control (AGC)

The Adaptive Gain Control circuit amplifies the incoming analog signal and compensates for the various flat losses and also for the loss at one-half symbol rate. The AGC has a dynamic range of 30 dB. The peak detector provides feedback to the equalizer before slicing occurs.

3.3 Receive Equalizer

The Equalizer restores the integrity of the signal and compensates for the frequency dependent attenuation of up to 900 feet of coaxial cable (1300 feet for E3). The Equalizer also boosts the high frequency content of the signal to reduce Inter-Symbol Interference (ISI) so that the slicer slices the signal at 50% of peak voltage to generate Positive and Negative data. The equalizer can be disabled by programming the appropriate register.

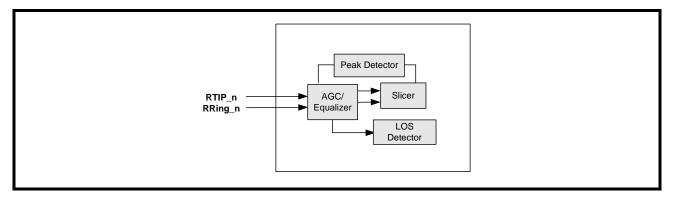

REV. 1.0.4

XRT75R12

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

FIGURE 7. ACG/EQUALIZER BLOCK DIAGRAM

3.3.1 Recommendations for Equalizer Settings

The Equalizer has two gain settings to provide optimum equalization. In the case of normally shaped DS3/ STS-1 pulses (pulses that meet the template requirements) that has been driven through 0 to 900 feet of cable, the Equalizer can be enabled. However, for square-shaped pulses such as E3 or for DS3/STS-1 high pulses (that does not meet the pulse template requirements), it is recommended that the Equalizer be disabled for cable length less than 300 feet. This would help to prevent over-equalization of the signal and thus optimize the performance in terms of better jitter transfer characteristics. The Equalizer also contains an additional 20 dB gain stage to provide the line monitoring capability (Receive Monitor Mode) of the resistively attenuated signals which may have 20dB flat loss. The equalizer and the equalizer gain mode can be enabled by programming the appropriate register. However, enabling the equalizer gain mode (Receive Monitor Mode) suppresses the internal LOS circuitry and LOS will never assert nor LOS be declared when operating with Receive Monitor Mode enabled.

Note: The results of extensive testing indicate that even when the Equalizer was enabled, regardless of the cable length, the integrity of the E3 signal was restored properly over 0 to 12 dB cable loss at Industrial Temperature.

3.4 Clock and Data Recovery

The Clock and Data Recovery Circuit extracts the embedded clock, RxClk_n from the sliced digital data stream and provides the retimed data to the B3ZS (HDB3) decoder. The Clock Recovery PLL can be in one of the following two modes:

3.4.1 Data/Clock Recovery Mode

In the presence of input line signals on the RTIP_n and RRing_n input pins and when the frequency difference between the recovered clock signal and the reference clock signal is less than 0.5%, the clock that is output on the RxClk_n out pins is the Recovered Clock signal.

3.4.2 Training Mode

In the absence of input signals at RTIP_n and RRing_n pins, or when the frequency difference between the recovered line clock signal and the reference clock applied on the ExClk_n input pins exceed 0.5%, a Loss of Lock condition is declared by toggling RLOL_n output pin "High" or setting the RLOL_n bit to "1" in the control register. Also, the clock output on the RxClk_n pins are the same as the reference channel clock.

3.5 LOS (Loss of Signal) Detector

3.5.1 DS3/STS-1 LOS Condition

A Digital Loss of SIgnal (DLOS) condition occurs when a string of 175 ± 75 consecutive zeros occur on the line. When the DLOS condition occurs, the DLOS_n bit is set to "1" in the status control register. DLOS condition is cleared when the detected average pulse density is greater than 33% for 175 ± 75 pulses. Analog Loss of Signal (ALOS) condition occurs when the amplitude of the incoming line signal is below the threshold as shown in the **Table 3**. The status of the ALOS condition is reflected in the ALOS_n status control register. RLOS is the logical OR of the DLOS and ALOS states. When the RLOS condition occurs the RLOS_n output pin is toggled "High" and the RLOS_n bit is set to "1" in the status control register.

TABLE 3: THE ALOS (ANALOG LOS) DECLARATION AND CLEARANCE THRESHOLDS FOR A GIVEN SETTING OF REQEN (DS3 AND STS-1 Applications)

APPLICATION	REQEN SETTING	SIGNAL LEVEL TO DECLARE ALOS DEFECT	SIGNAL LEVEL TO CLEAR ALOS DEFECT
DS3	0	< 41mVpk	> 102mVpk
	1	< 52mVpk	> 117mVpk
STS-1	0	< 51mVpk	> 114mVpk
	1	< 58mVpk	> 133mVpk

3.5.2 Disabling ALOS/DLOS Detection

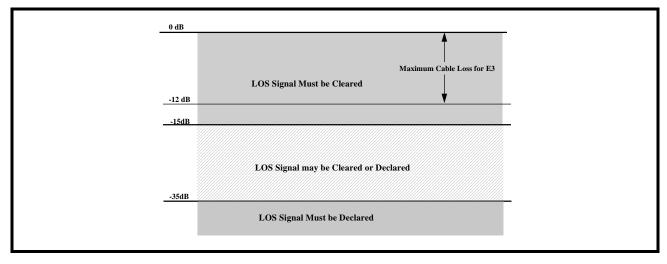

For debugging purposes it is useful to disable the ALOS and/or DLOS detection. Writing a "1" to both ALOSDIS_n and DLOSDIS_n bits disables the LOS detection on a per channel basis.

3.5.3 E3 LOS Condition:

XRT75R12

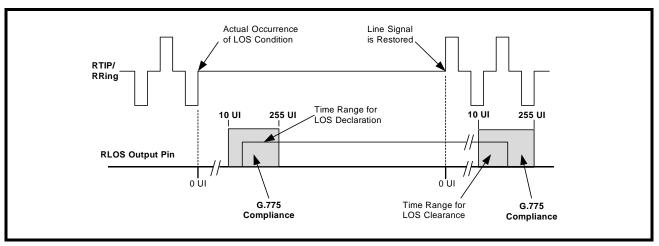

If the level of incoming line signal drops below the threshold as described in the ITU-T G.775 standard, the LOS condition is detected. Loss of signal is defined as no transitions for 10 to 255 consecutive zeros. No transitions is defined as a signal level between 15 and 35 dB below the normal. This is illustrated in Figure 8. The LOS condition is cleared within 10 to 255 UI after restoration of the incoming line signal. Figure 9 shows the LOS declaration and clearance conditions.

FIGURE 8. LOSS OF SIGNAL DEFINITION FOR E3 AS PER ITU-T G.775

3.5.4 Interference Tolerance

For E3 mode, ITU-T G.703 Recommendation specifies that the receiver be able to recover error free clock and data in the presence of a sinusoidal interfering tone signal. For DS3 and STS-1 modes, the same recommendation is being used. Figure 10 shows the configuration to test the interference margin for DS3/STS1. Figure 11 shows the set up for E3.

FIGURE 10. INTERFERENCE MARGIN TEST SET UP FOR DS3/STS-1

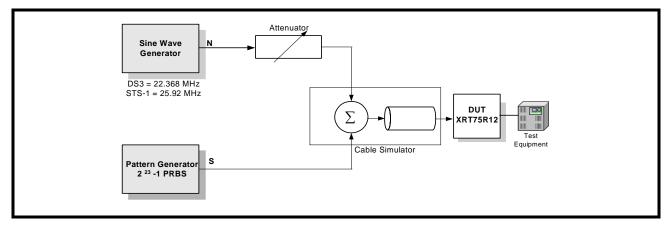

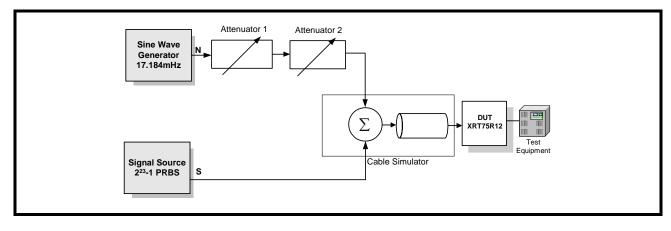

FIGURE 11. INTERFERENCE MARGIN TEST SET UP FOR E3.

Mode	CABLE LENGTH (ATTENUATION)	INTERFERENCE TOLERANCE
		Equalizer "IN"
E3	0 dB	-17 dB
	12 dB	-14 dB
	0 feet	-15 dB
DS3	225 feet	-15 dB
	450 feet	-14 dB
	0 feet	-15 dB
STS-1	225 feet	-14 dB
	450 feet	-14 dB

TABLE 4: INTERFERENCE MARGIN TEST RESULTS

3.5.5 Muting the Recovered Data with LOS condition:

→ t_{co}

RPOS or RNEG

When the LOS condition is declared, the clock recovery circuit locks into the reference clock applied to the internal master clock outputs this clock onto the RxClk_n output pin. The data on the RxPOS_n and RxNEG_n pins can be forced to zero by setting the LOSMUT_n bits in the individual channel control register to "1".

Note: When the LOS condition is cleared, the recovered data is output on RxPOS_n and RxNEG_n pins.

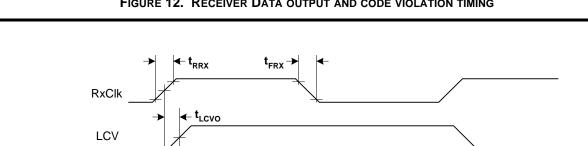

FIGURE 12. RECEIVER DATA OUTPUT AND CODE VIOLATION TIMING

SYMBOL	PARAMETER	MIN	TYP	MAX	UNITS
RxClk	Duty Cycle	45	50	55	%
	RxClk Frequency				
	E3		34.368		MHz
	DS-3		44.736		MHz
	STS-1		51.84		MHz
t _{RRX}	RxClk rise time (10% o 90%)		2	4	ns
t _{FRX}	RxClk falling time (10% to 90%)		2	4	ns
t _{CO}	RxClk to RPOS/RNEG delay time			4	ns
t _{LCVO}	RxClk to rising edge of LCV output delay		2.5		ns

3.6 B3ZS/HDB3 Decoder

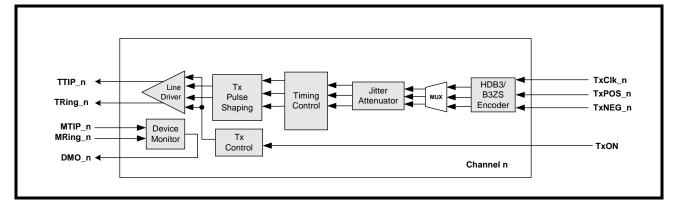

The decoder block takes the output from the clock and data recovery block and decodes the B3ZS (for DS3 or STS-1) or HDB3 (for E3) encoded line signal and detects any coding errors or excessive zeros in the data stream. Whenever the input signal violates the B3ZS or HDB3 coding sequence for bipolar violation or contains three (for B3ZS) or four (for HDB3) or more consecutive zeros, an active "High" pulse is generated on the RLCV_n output pins to indicate line code violation.

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

4.0 THE TRANSMITTER SECTION

The transmitter is designed so that the LIU can accept serial data from a local device, encode the data properly, and then output an analog pulse according to the pulse shape chosen in the appropriate registers. This section describes the detailed operation of various blocks within the transmit path. A simplified block diagram of the transmit path is shown in Figure 13.

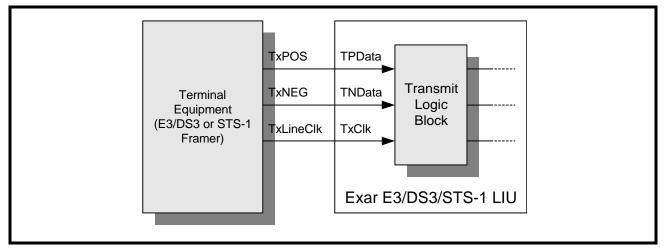

4.1 Transmit Digital Input Interface

The method for applying data to the transmit inputs of the LIU is a serial interface consisting of TxClk, TxPOS, and TxNEG. For single rail mode, only TxClk and TxPOS are necessary for providing the local data from a Framer device or ASIC. Data can be sampled on either edge of the input clock signal by programming the appropriate register. A typical interface is shown in Figure 14.

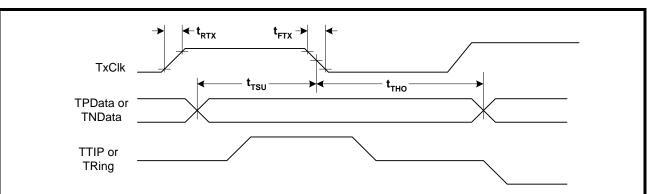

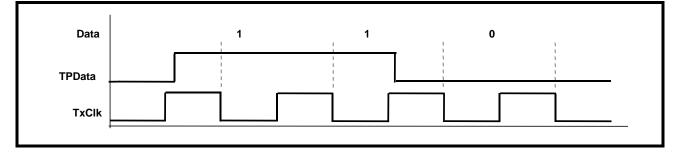

FIGURE 15. TRANSMITTER TERMINAL INPUT TIMING

SYMBOL	PARAMETER	MIN	TYP	MAX	UNITS
TxClk	Duty Cycle	30	50	70	%
	TxClk Frequency				
	E3		34.368		MHz
	DS-3		44.736		MHz
	STS-1		51.84		MHz
t _{RTX}	TxClk Rise Time (10% to 90%)			4	ns

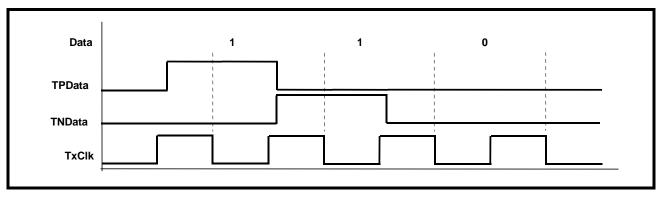

FIGURE 16. SINGLE-RAIL OR NRZ DATA FORMAT (ENCODER AND DECODER ARE ENABLED)

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

EXAR Experience Our Connectivity. REV. 1.0.4

FIGURE 17. DUAL-RAIL DATA FORMAT (ENCODER AND DECODER ARE DISABLED)

4.2 Transmit Clock

The Transmit Clock applied via TxClk_n pins, for the selected data rate (for E3 = 34.368 MHz, DS3 = 44.736 MHz or STS-1 = 51.84 MHz), is duty cycle corrected by the internal PLL circuit to provide a 50% duty cycle clock to the pulse shaping circuit. This allows a 30% to 70% duty cycle Transmit Clock to be supplied.

4.3 B3ZS/HDB3 Encoder

When the Single-Rail (NRZ) data format is selected, the Encoder Block encodes the data into either B3ZS format (for either DS3 or STS-1) or HDB3 format (for E3).

4.3.1 B3ZS Encoding

An example of B3ZS encoding is shown in **Figure 18**. If the encoder detects an occurrence of three consecutive zeros in the data stream, it is replaced with either B0V or 00V, where 'B' refers to Bipolar pulse that is compliant with the Alternating polarity requirement of the AMI (Alternate Mark Inversion) line code and 'V' refers to a Bipolar Violation (e.g., a bipolar pulse that violates the AMI line code). The substitution of B0V or 00V is made so that an odd number of bipolar pulses exist between any two consecutive violation (V) pulses. This avoids the introduction of a DC component into the line signal.

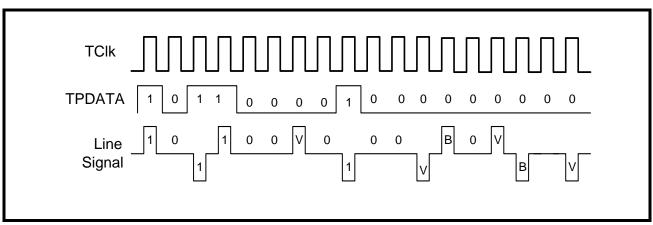

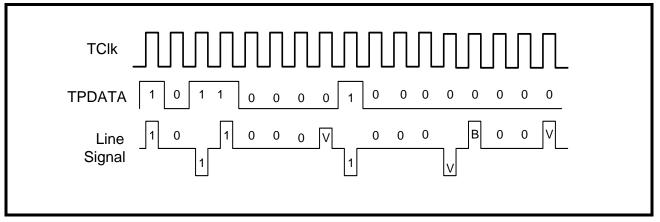

FIGURE 18. B3ZS ENCODING FORMAT

4.3.2 HDB3 Encoding

An example of the HDB3 encoding is shown in Figure 19. If the HDB3 encoder detects an occurrence of four consecutive zeros in the data stream, then the four zeros are substituted with either 000V or B00V pattern. The substitution code is made in such a way that an odd number of pulses exist between any consecutive V pulses. This avoids the introduction of DC component into the analog signal.

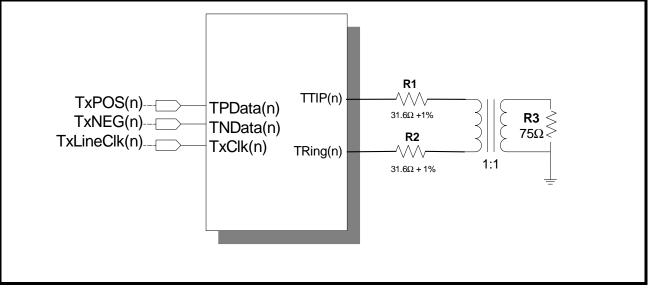

FIGURE 19. HDB3 ENCODING FORMAT

4.4 TRANSMIT PULSE SHAPER

The Transmit Pulse Shaper converts the B3ZS encoded digital pulses into a single analog Alternate Mark Inversion (AMI) pulse that meets the industry standard mask template requirements for STS-1 and DS3. For E3 mode, the pulse shaper converts the HDB3 encoded pulses into a single full amplitude square shaped pulse with very little slope. The Pulse Shaper Block also includes a Transmit Build Out Circuit, which can either be disabled or enabled by setting the TxLEV_n bit to "1" or "0" in the control register. For DS3/STS-1 rates, the Transmit Build Out Circuit is used to shape the transmit waveform that ensures that transmit pulse template requirements are met at the Cross-Connect system. The distance between the transmitter output and the Cross-Connect system can be between 0 to 450 feet. For E3 rate, since the output pulse template is measured at the secondary of the transformer and since there is no Cross-Connect system pulse template requirements, the Transmit Build Out Circuit is always disabled. The differential line driver increases the transmit waveform to appropriate level and drives into the 75 Ω load as shown in Figure 20.

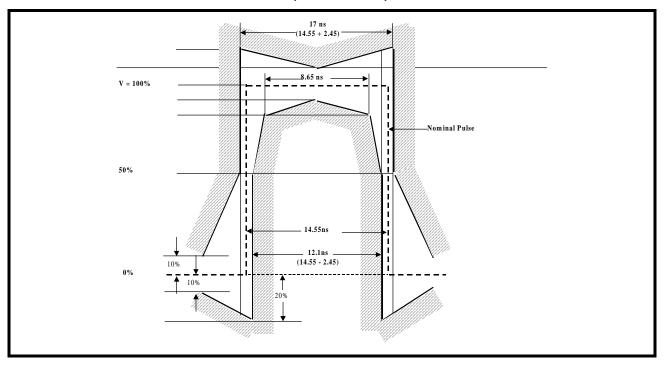

4.4.1 Guidelines for using Transmit Build Out Circuit

If the distance between the transmitter and the DSX3 or STSX-1, Cross-Connect system, is less than 225 feet, enable the Transmit Build Out Circuit by setting the TxLEV_n control bit to "0". If the distance between the transmitter and the DSX3 or STSX-1 is greater than 225 feet, disable the Transmit Build Out Circuit.

REV. 1.0.4

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

4.6 Transmit Drive Monitor

This feature is used for monitoring the transmit line for occurrence of fault conditions such as a short circuit on the line or a defective line driver. To activate this function, connect MTIP_n pins to the TTIP_n lines via a 270Ω resistor and MRing_n pins to TRing_n lines via 270Ω resistor as shown in Figure 24.

When the MTIP_n and MRing_n are connected to the TTIP_n and TRing_n lines, the drive monitor circuit monitors the line for transitions. The DMO_n (Drive Monitor Output) will be asserted "Low" as long as the transitions on the line are detected via MTIP_n and MRing_n. If no transitions on the line are detected for 128 \pm 32 TxClk_n periods, the DMO_n output toggles "High" and when the transitions are detected again, DMO_n toggles "Low".

Note: The Drive Monitor Circuit is only for diagnostic purpose and does not have to be used to operate the transmitter.

4.7 Transmitter Section On/Off

The transmitter section of each channel can either be turned on or off. To turn on the transmitter, set the input pin TxON to "High" and write a "1" to the TxON_n control bit. When the transmitter is turned off, TTIP_n and TRing_n are tri-stated.

Notes:

- 1. This feature provides support for Redundancy.
- 2. If the XRT75R12 is configured in Host mode, to permit a system designed for redundancy to quickly shut-off the defective line card and turn on the back-up line card, writing a "1" to the TxON_n control bits transfers the control to TxON pin.

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

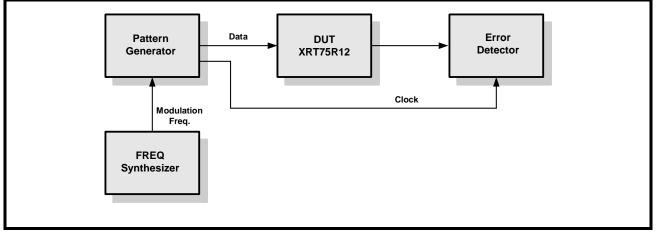

5.0 JITTER

There are three fundamental parameters that describe circuit performance relative to jitter

- Jitter Tolerance
- Jitter Transfer
- Jitter Generation
- 5.1 JITTER TOLERANCE

Jitter tolerance is a measure of how well a Clock and Data Recovery unit can successfully recover data in the presence of various forms of jitter. It is characterized by the amount of jitter required to produce a specified bit error rate. The tolerance depends on the frequency content of the jitter. Jitter Tolerance is measured as the jitter amplitude over a jitter spectrum for which the clock and data recovery unit achieves a specified bit error rate (BER). To measure the jitter tolerance as shown in Figure 25, jitter is introduced by the sinusoidal modulation of the serial data bit sequence. Input jitter tolerance requirements are specified in terms of compliance with jitter mask which is represented as a combination of points. Each point corresponds to a minimum amplitude of sinusoidal jitter at a given jitter frequency.

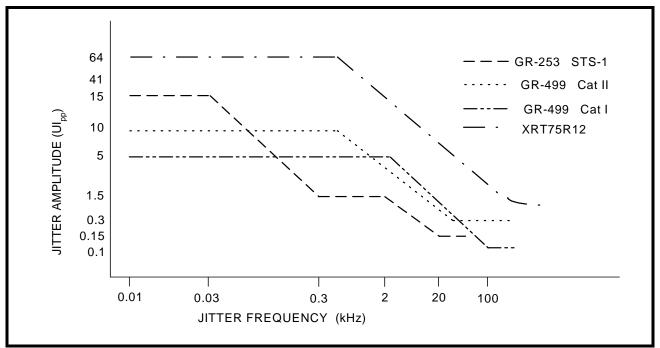

5.1.1 DS3/STS-1 Jitter Tolerance Requirements

Bellcore GR-499 CORE specifies the minimum requirement of jitter tolerance for Category I and Category II. The jitter tolerance requirement for Category II is the most stringent. Figure 26 shows the jitter tolerance curve as per GR-499 specification.

5.1.2 E3 Jitter Tolerance Requirements

ITU-T G.823 standard specifies that the clock and data recovery unit must be able to tolerate jitter up to certain specified limits. Figure 27 shows the tolerance curve.

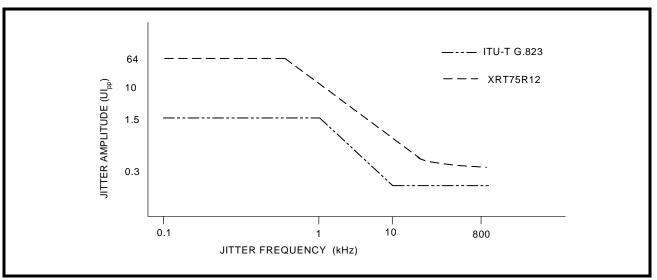

FIGURE 27. INPUT JITTER TOLERANCE FOR E3

As shown in the Figures above, in the jitter tolerance measurement, the dark line indicates the minimum level of jitter that the E3/DS3/STS-1 compliant component must tolerate. Table 10 below shows the jitter amplitude versus the modulation frequency for various standards.

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

BIT RATE	STANDARD	INPUT JITTER AMPLITUDE (UI _{P-P})			MODULATION FREQUENCY				
(кв/s)	s)	A1	A2	A3	F1(Hz)	F2(Hz)	F3(кHz)	F4(KHZ)	ғ5(кHz)
34368	ITU-T G.823	1.5	0.15	-	100	1000	10	800	-
44736	GR-499 CORE Cat I	5	0.1	-	10	2.3k	60	300	-
44736	GR-499 CORE Cat II	10	0.3	-	10	669	22.3	300	-
51840	GR-253 CORE Cat II	15	1.5	0.15	10	30	300	2	20

TABLE 10: JITTER AMPLITUDE VERSUS MODULATION FREQUENCY (JITTER TOLERANCE)

5.2 JITTER TRANSFER

Jitter Transfer function is defined as the ratio of jitter on the output relative to the jitter applied on the input versus frequency. There are two distinct characteristics in jitter transfer, jitter gain (jitter peaking) defined as the highest ratio above 0dB and jitter transfer bandwidth. The overall jitter transfer bandwidth is controlled by a low bandwidth loop, typically using a voltage-controlled crystal oscillator (VCXO).

The jitter transfer function is a ratio between the jitter output and jitter input for a component, or system often expressed in dB. A negative dB jitter transfer indicates the element removed jitter. A positive dB jitter transfer indicates the element had no effect on jitter. Table 11 shows the jitter transfer characteristics and/or jitter attenuation specifications for various data rates:

TABLE 11: JITTER TRANSFER SPECIFICATION/REFERENCES

E3	DS3	STS-1
ETSI TBR-24	GR-499 CORE section 7.3.2 Category I and Category II	GR-253 CORE section 5.6.2.1

Note: The above specifications can be met only with a jitter attenuator that supports E3/DS3/STS-1 rates.

5.3 Jitter Attenuator

An advanced crystal-less jitter attenuator per channel is included in the XRT75R12. The jitter attenuator requires no external crystal nor high-frequency reference clock. By clearing or setting the JATx/Rx_n bits in the channel control registers selects the jitter attenuator either in the Receive or Transmit path on per channel basis. The FIFO size can be either 16-bit or 32-bit. The bits JA0_n and JA1_n can be set to appropriate combination to select the different FIFO sizes or to disable the Jitter Attenuator on a per channel basis. Data is clocked into the FIFO with the associated clock signal (TxClk or RxClk) and clocked out of the FIFO with the dejittered clock. When the FIFO is within two bits of overflowing or underflowing, the FIFO limit status bit, FL_n is set to "1" in the Alarm status register. Reading this bit clears the FIFO and resets the bit into default state.

Note: It is recommended to select the 16-bit FIFO for delay-sensitive applications as well as for removing smaller amounts of jitter. Table 12 specifies the jitter transfer mask requirements for various data rates:

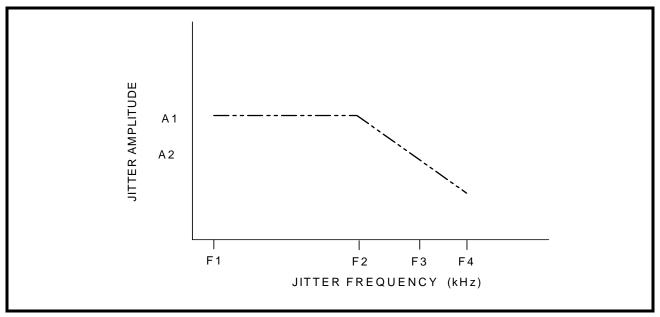

Rate (kbits)	Mask	F1 (Hz)	F2 (Hz)	F3 (Hz)	F4 (кНz)	A1(dB)	A2(dB)
34368	G.823 ETSI-TBR-24	100	300	Зк	800ĸ	0.5	-19.5
44736	GR-499, Cat I GR-499, Cat II GR-253 CORE	10 10 10	10k 56.6k 40	- -	15k 300k 15k	0.1 0.1 0.1	- -
51840	GR-253 CORE	10	40k	-	400k	0.1	-

TABLE 12: JITTER TRANSFER PASS MASKS

The jitter attenuator within the XRT75R12 meets the latest jitter attenuation specifications and/or jitter transfer characteristics as shown in the Figure 28.

5.3.1 JITTER GENERATION

Jitter Generation is defined as the process whereby jitter appears at the output port of the digital equipment in the absence of applied input jitter. Jitter Generation is measured by sending jitter free data to the clock and data recovery circuit and measuring the amount of jitter on the output clock or the re-timed data. Since this is essentially a noise measurement, it requires a definition of bandwidth to be meaningful. The bandwidth is set according to the data rate. In general, the jitter is measured over a band of frequencies.

6.0 DIAGNOSTIC FEATURES

6.1 PRBS Generator and Detector

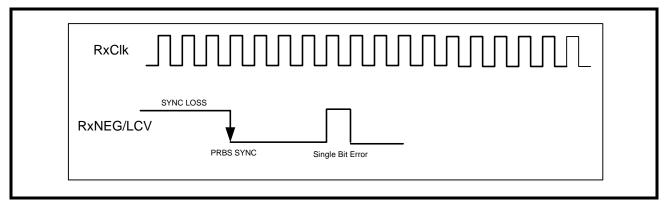

The XRT75R12 contains an on-chip Pseudo Random Binary Sequence (PRBS) generator and detector for diagnostic purpose. With the PRBSEN_n bit = "1", the transmitter will send out PRBS of 2^{23} -1 in E3 rate or 2^{15} -1 in STS-1/DS3 rate. At the same time, the receiver PRBS detector is also enabled. When the correct PRBS pattern is detected by the receiver, the RNEG/LCV pin will go "Low" to indicate PRBS synchronization has been achieved. When the PRBS detector is not in sync the PRBSLS bit will be set to "1" and RNEG/LCV pin will go "High".

With the PRBS mode enabled, the user can also insert a single bit error by toggling "INSPRBS" bit. This is done by writing a "1" to INSPRBS bit. The receiver at RNEG/LCV pin will pulse "High" for one RxClk cycle for every bit error detected. Any subsequent single bit error insertion must be done by first writing a "0" to INSPRBS bit and followed by a "1".

Figure 29 shows the status of RNEG/LCV pin when the XRT75R12 is configured in PRBS mode.

NOTE: In PRBS mode, the device is forced to operate in Single-Rail Mode.

6.2 LOOPBACKS

The XRT75R12 offers three loopback modes for diagnostic purposes. The loopback modes are selected via the RLB_n and LLB_n bits n the Channel control registers select the loopback modes.

6.2.1 ANALOG LOOPBACK

In this mode, the transmitter outputs TTIP_n and TRing_n are internally connected to the receiver inputs RTIP_n and RRing_n as shown in Figure 30. Data and clock are output at RxClk_n, RxPOS_n and RxNEG_n pins for the corresponding transceiver. Analog loopback exercises most of the functional blocks of the device including the jitter attenuator which can be selected in either the transmit or receive path.

DATA &

CLOCK

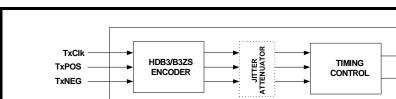

RECOVERY

Notes:

1. In the Analog loopback mode, data is also output via TTIP_n and TRing_n pins.

DECODER

FIGURE 30. ANALOG LOOPBACK

RxClk

RxPOS -

RxNEG -

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

6.2.2 DIGITAL LOOPBACK

When the Digital Loopback is selected, the transmit clock TxClk_n and transmit data inputs (TxPOS_n & TxNEG_n are looped back and output onto the RxClk_n, RxPOS_n and RxNEG_n pins as shown in Figure 31.

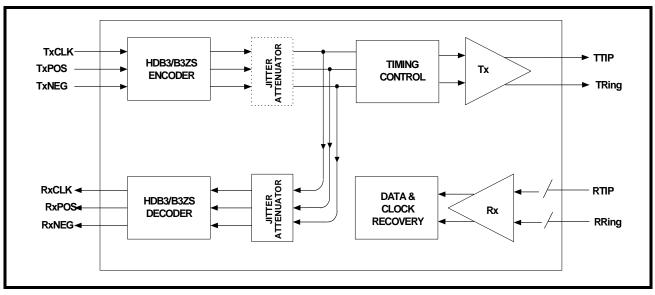

FIGURE 31. DIGITAL LOOPBACK

6.2.3 REMOTE LOOPBACK

With Remote loopback activated as shown in Figure 32, the receive data on RTIP and RRing is looped back after the jitter attenuator (if selected in receive or transmit path) to the transmit path using RxClk as transmit timing. The receive data is also output via the RxPOS and RxNEG pins.

NOTE: Input signals on TxClk, TxPOS and TxNEG are ignored during Remote loopback.

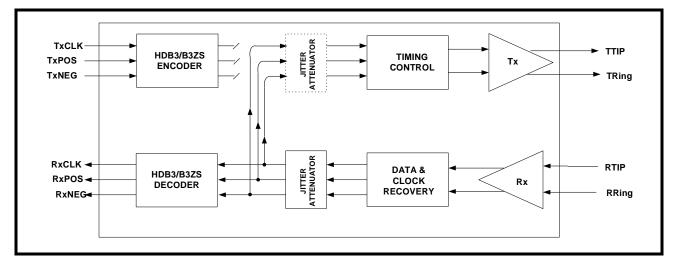

FIGURE 32. REMOTE LOOPBACK

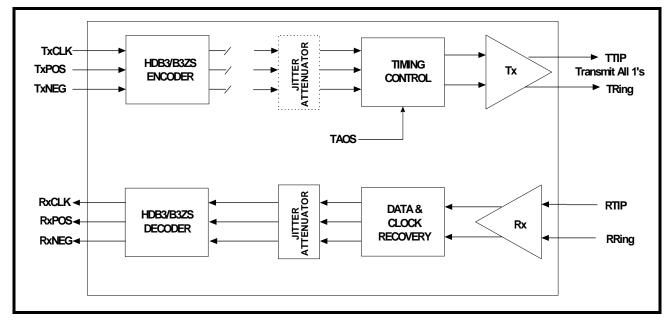

Experience Our Connectivity.

REV. 1.0.4 TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

6.3 TRANSMIT ALL ONES (TAOS)

Transmit All Ones (TAOS) can be set by setting the TAOS_n control bits to "1" in the Channel control registers. When the TAOS is set, the Transmit Section generates and transmits a continuous AMI all "1's" pattern on TTIP_n and TRing_n pins. The frequency of this ones pattern is determined by TxClk_n. the TAOS data path is shown in **Figure 33**. TAOS does not operate in Analog loopback or Remote loopback modes, however will function in Digital loopback mode.

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

7.0 MICROPROCESSOR INTERFACE BLOCK

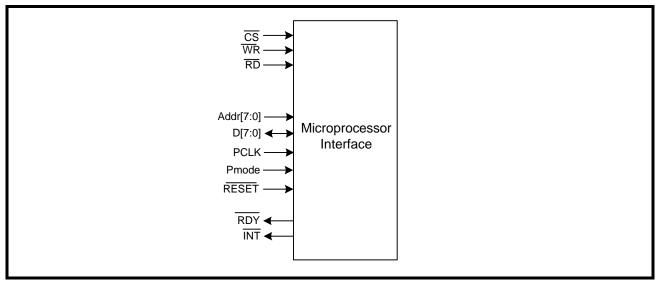

The Microprocessor Interface section supports communication between the local microprocessor (μ P) and the LIU. The XRT75R12 supports a parallel interface asynchronously or synchronously timed to the LIU. The microprocessor interface is selected by the state of the Pmode input pin. Selecting the microprocessor interface mode is shown in Table 13.

Рмоде	MICROPROCESSOR MODE
"Low"	Asynchronous Mode
"High"	Synchronous Mode

TABLE 13: SELECTING THE MICROPROCESSOR INTERFACE MOD	ЭE
--	----

The local μ P configures the LIU by writing data into specific addressable, on-chip Read/Write registers. The μ P provides the signals which are required for a general purpose microprocessor to read or write data into these registers. The μ P also supports polled and interrupt driven environments. A simplified block diagram of the microprocessor is shown in Figure 34.

7.1 The Microprocessor Interface Block Signals

The LIU may be configured into different operating modes and have its performance monitored by software through a standard microprocessor using data, address and control signals. These interface signals are described below in Table 14. The microprocessor interface can be configured to operate in Asynchronous mode or Synchronous mode.

PIN NAME	Түре	DESCRIPTION
Pmode	I	Microprocessor Interface Mode Select Input pin This pin is used to specify the microprocessor interface mode.
D[7:0]	I/O	Bi-Directional Data Bus for register "Read" or "Write" Operations.
Addr[7:0]	I	Eight-Bit Address Bus Inputs The XRT75R12 LIU microprocessor interface uses a direct address bus. This address bus is provided to permit the user to select an on-chip register for Read/Write access.

 TABLE 14: XRT75R12 MICROPROCESSOR INTERFACE SIGNALS

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

TABLE 14: XRT75R12 MICROPROCESSOR INTERFACE SIGNALS

PIN NAME	Түре	DESCRIPTION
CS	I	Chip Select Input This active low signal selects the microprocessor interface of the XRT75R12 LIU and enables Read/Write operations with the on-chip register locations.
RD	I	Read Signal This active low input functions as the read signal from the local μ P. When this pin is pulled "Low" (if \overline{CS} is "Low") the LIU is informed that a read operation has been requested and begins the process of the read cycle.
WR	I	Write Signal This active low input functions as the write signal from the local μ P. When this pin is pulled "Low" (if \overline{CS} is "Low") the LIU is informed that a write operation has been requested and begins the process of the write cycle.
RDY	0	Ready Output This active low signal is provided by the LIU device. It indicates that the current read or write cycle is complete, and the LIU is waiting for the next command.
ĪNT	0	Interrupt Output This active low signal is provided by the LIU to alert the local mP that a change in alarm status has occured. This pin is Reset Upon Read (RUR) once the alarm status registers have been cleared.
RESET	I	Reset Input This active low input pin is used to Reset the LIU.

7.2 Asynchronous and Synchronous Description

Whether the LIU is configured for Asynchronous or Synchronous mode, the following descriptions apply. The synchronous mode requires an input clock (PCLK) to be used as the microprocessor timing reference. Read and Write operations are described below.

Read Cycle (For Pmode = "0" or "1")

Whenever the local μ P wishes to read the contents of a register, it should do the following.

- 1. Place the address of the target register on the address bus input pins Addr[7:0].
- 2. While the μP is placing this address value on the address bus, the address decoding circuitry should assert the CS pin of the LIU, by toggling it "Low". This action enables communication between the μP and the LIU microprocessor interface block.
- Next, the μP should indicate that this current bus cycle is a Read operation by toggling the RD input pin "Low". This action enables the bi-directional data bus output drivers of the LIU.
- **4.** After the μ P toggles the Read signal "Low", the LIU will toggle the \overline{RDY} output pin "Low". The LIU does this to inform the μ P that the data is available to be read by the μ P, and that it is ready for the next command.
- After the µP detects the RDY signal and has read the data, it can terminate the Read Cycle by toggling the RD input pin "High".
- **6.** The \overline{CS} input pin must be pulled "High" before a new command can be issued.

Write Cycle (For Pmode = "0" or "1")

Whenever a local μ P wishes to write a byte or word of data into a register within the LIU, it should do the following.

- 1. Place the address of the target register on the address bus input pins Addr[7:0].
- 2. While the μP is placing this address value on the address bus, the address decoding circuitry should assert the CS pin of the LIU, by toggling it "Low". This action enables communication between the μP and the LIU microprocessor interface block.
- **3.** The μP should then place the byte or word that it intends to write into the target register, on the bi-directional data bus D[7:0].
- **4.** Next, the μP should indicate that this current bus cycle is a Write operation by toggling the WR input pin "Low". This action enables the bi-directional data bus input drivers of the LIU.

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

- After the µP toggles the Write signal "Low", the LIU will toggle the RDY output pin "Low". The LIU does this
 to inform the µP that the data has been written into the internal register location, and that it is ready for the
 next command.
- **6.** The \overline{CS} input pin must be pulled "High" before a new command can be issued.

THE GLOBAL/CHIP-LEVEL REGISTERS

The register set, within the XRT75R12 contains ten global or chip-level registers. These registers control operations in more than one channel or apply to the complete chip. This section will present detailed information on the Global Registers.

Bit Number	NAME	Түре	DESCRIPTION
7,6	Reserved		
5	RxON Ch 11	R/W	Receive Section ON - Channel n
4	RxON Ch 10		This READ/WRITE bit-field is used to turn on or turn off the Receiver associated with
3	RxON Ch 9		Channel n on a per channel basis. If the user turns on the Receiver, then Channel n
2	RxON Ch 8		will Receive DS3, E3 or STS-1 pulses on the line via the RTIP_n and RRING_ n input
1	RxON Ch 7		pins.
0	RxON Ch 6		Conversely, if the user turns off the Receiver Driver (for channel n), the RTIP_n and RRING_n input pins will be in a high impedance state.
			0 - Shuts off the Receive Driver associated with Channel n and puts the RTIP_n and RRING_ n input pins in a high impedance state.
			1 - Turns on the Receive Driver associated with Channel n.

TABLE 23: CHANNEL LEVEL INTERRUPT ENABLE REGISTER - CR96 (ADDRESS LOCATION = 0x60)

Віт 7	Віт 6	Віт 5	Віт 4	Віт 3	Віт 2	Віт 1	Віт 0
Reserved	Reserved	Channel 5 Interrupt Enable	Channel 4 Interrupt Enable	Channel 3 Interrupt Enable	Channel 2 Interrupt Enable	Channel 1 Interrupt Enable	Channel 0 Interrupt Enable
		R/W	R/W	R/W	R/W	R/W	R/W

Bit Number	NAME	Түре	DESCRIPTION
7,6	Unused		
5	Channel 5 Interrupt Enable	R/W	Channel n Interrupt Enable Bit:
4	Channel 4 Interrupt Enable		This READ/WRITE bit is used to:
3	Channel 3 Interrupt Enable		• To enable Channel n for Interrupt Generation at the Channel
2	Channel 2 Interrupt Enable		Level
1	Channel 1 Interrupt Enable		• To disable all Interrupts associated with Channel n within the
0	Channel 0 Interrupt Enable		XRT75R12
			This is a "master" enable bit for each channel. This bit allows control on a per channel basis to signal the Host of selected error conditions.
			If a bit is cleared, no interrupts from that channel will be sent to the Host via the INT.
			If the bit is set (logic 1), any generated interrupt in channel n that has been enabled in the Interrupt Enable register (IERn) for the channel will activate the INT pin to the Host.
			0 - Disables all Channel n related Interrupts.
			1 - Enables Channel n-related Interrupts. The user must enable individual Channel n related Interrupts at the source level, before they are can generate an interrupt.

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

TABLE 24: CHANNEL LEVEL INTERRUPT STATUS REGISTER - CR97 (ADDRESS LOCATION = 0x61)

The last six channels are serviced through this location and the other six at address 0x61. These two registers are used by the Host to identify the source channel of an active interrupt. 0 - Indicates that there is NO Channel n-related Interrupt awaiting service. 1 - Indicates that there is at least one Channel n-related Interrupt awaiting service. 1 - Indicates that there is at least one Channel n-related Interrupt awaiting service. In this case, the user's Interrupt Service routine should be written such that the Microprocessor will now proceed to read out the contents of the Source Level Interrupt Status Register - Channel n (Address Locations = 0xn2) to determine the exact source of the interrupt request. Note: Once this bit-field is set to "1", it will not be cleared back to "0" until the user has read out the contents of the Source-Level Interrupt Status Register bit, that corresponds to the interrupt request channel.

7	7 Reserved		
6	Loss of PRBS Pat-	R/O	Loss of PRBS Pattern Lock Indicator:
	tern Lock		This READ-ONLY bit-field indicates whether or not the PRBS Receiver (within the Receive Section of Channel n) is declaring PRBS Lock within the incoming PRBS pattern.
			If the PRBS Receiver detects a very large number of bit-errors within its incoming data-stream, then it will declare the Loss of PRBS Lock Condition.
			Conversely, if the PRBS Receiver were to detect its pre-determined PRBS pattern with the incoming DS3, E3 or STS-1 data-stream, (with little or no bit errors) then the PRBS Receiver will clear the Loss of PRBS Lock condition.
			0 - Indicates that the PRBS Receiver is currently declaring the PRBS Lock condition within the incoming DS3, E3 or STS-1 data-stream.
			1 - Indicates that the PRBS Receiver is currently declaring the Loss of PRBS Lock condition within the incoming DS3, E3 or STs-1 data-stream.
			Note: This register bit is only valid if all of the following are true.
			 The PRBS Generator block (within the Transmit Section of the Chip is enabled).
			b. The PRBS Receiver is enabled.
			c. The PRBS Pattern (that is generated by the PRBS Generator) is somehow looped back into the Receive Path (via the Line-Side) and in-turn routed to the receive input of the PRBS Receiver.

XRT75R12

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

TABLE 34: ALARM STATUS REGISTER - CHANNEL n ADDRESS LOCATION = 0XM3

BIT NUMBER	ΝΑΜΕ	Түре	DESCRIPTION	
5	Digital LOS Defect Declared	R/O	Digital LOS Defect Declared: This READ-ONLY bit-field indicates whether or not the Digital LOS (Loss of Signal) detector is declaring the LOS Defect condition. For DS3 and STS-1 applications, the Digital LOS Detector will declare the LOS Defect condition whenever it detects an absence of pulses (within the incoming DS3 or STS-1 data-stream) for 160 consecutive bit-periods. Further, (again for DS3 and STS-1 applications) the Digital LOS Detector will clear the LOS Defect condition whenever it determines that the pulse density (within the incoming DS3 or STS-1 signal) is at least 33%. 0 - Indicates that the Digital LOS Detector is NOT declaring the LOS Defect condition. 1 - Indicates that the Digital LOS Detector is currently declaring the LOS Defect condition. NOTES: 1. LOS Detection (within each channel of the XRT75R12) is performed by both an Analog LOS Detector and a Digital LOS Detector. The LOS state of a given Channel is simply a WIRED-OR of the LOS Defect Declare states of these two detectors.	
			 The current LOS Defect Condition (for the channel) can be determined by reading out the contents of Bit 1 (Receive LOS Defect Declared) within this register. 	
4	Analog LOS Defect Declared	R/O	 Analog LOS Defect Declared: This READ-ONLY bit-field indicates whether or not the Analog LOS (Loss of Signal) detector is declaring the LOS Defect condition. For DS3 and STS-1 applications, the Analog LOS Detector will declare the LOS Defect condition whenever it determines that the amplitude of the pulses (within the incoming DS3/STS-1 line signal) drops below a certain Analog LOS Defect Declaration threshold level. Conversely, (again for DS3 and STS-1 applications) the Analog LOS Detector will clear the LOS Defect condition whenever it determines that the amplitude of the pulses (within the incoming DS3/STS-1 line signal) has risen above a certain Analog LOS Defect Clearance threshold level. It should be noted that, in order to prevent "chattering" within the Analog LOS Defect Declaration and the Analog LOS Defect Clearance threshold levels. 0 - Indicates that the Analog LOS Detector is NOT declaring the LOS Defect Condition. 1 - Indicates that the Analog LOS Detector is currently declaring the LOS Defect condition. NOTES: LOS Detection (within each channel of the XRT75R12) is performed by both an Analog LOS Detector and a Digital LOS Detector. The LOS State of a given Channel is simply a WIRED-OR of the LOS Defect Declare states of these two detectors. 	

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

TABLE 34: ALARM STATUS REGISTER - CHANNEL n ADDRESS LOCATION = 0XM3

BIT NUMBER	NAME	Түре	DESCRIPTION
3	FL Alarm Declared	R/O	 FL (FIFO Limit) Alarm Declared: This READ-ONLY bit-field indicates whether or not the Jitter Attenuator block (within Channel_n) is currently declaring the FIFO Limit Alarm. The Jitter Attenuator block will declare the FIFO Limit Alarm anytime the Jitter Attenuator FIFO comes within two bit-periods of either overflowing or under-running. Conversely, the Jitter Attenuator block will clear the FIFO Limit Alarm anytime the Jitter Attenuator FIFO is NO longer within two bit-periods of either overflowing or under-running. Typically, this Alarm will only be declared whenever there is a very serious problem with timing or jitter in the system. 0 - Indicates that the Jitter Attenuator block (within Channel_n) is NOT currently declaring the FIFO Limit Alarm condition. 1 - Indicates that the Jitter Attenuator block (within Channel_n) is currently declaring the FIFO Limit Alarm condition. NOTE: This bit-field is only active if the Jitter Attenuator (within Channel_n) has been enabled.
2	Receive LOL Condi- tion Declared	R/O	Receive LOL (Loss of Lock) Condition Declared: This READ-ONLY bit-field indicates whether or not the Receive Section (within Channel_n) is currently declaring the LOL (Loss of Lock) condition. The Receive Section (of Channel_n) will declare the LOL Condition, if the frequency of the Recovered Clock signal differs from that of the reference clock programmed for that channel (from the appropriate oscillator or the SFM clock synthesizer if in that mode) by 0.5% (or 5000ppm) or more . 0 - Indicates that the Receive Section of Channel_n is NOT currently declar- ing the LOL Condition. 1 - Indicates that the Receive Section of Channel_n is currently declaring the LOL Condition and the recovered clock differs by more than 0.5%.

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

TABLE 34: ALARM STATUS REGISTER - CHANNEL n ADDRESS LOCATION = 0XM3

BIT NUMBER	NAME	Түре	DESCRIPTION
1	Receive LOS Defect Condition Declared	R/O	 Receive LOS (Loss of Signal) Defect Condition Declared: This READ-ONLY bit-field indicates whether or not the Receive Section (within Channel_n) is currently declaring the LOS defect condition. The Receive Section (of Channel_n) will declare the LOS defect condition, if any one of the following conditions is met. If the Digital LOS Detector declares the LOS defect condition (for DS3 or STS-1 applications) If the Analog LOS Detector declares the LOS defect condition (for DS3 or STS-1 applications) If the ITU-T G.775 LOS Detector declares the LOS defect condition (for E3 applications). Indicates that the Receive Section of Channel_n is NOT currently declar- ing the LOS Defect Condition. Indicates that the Receive Section of Channel_n is currently declaring the LOS Defect condition.
0	Transmit DMO Con- dition Declared	R/O	 Transmit DMO (Drive Monitor Output) Condition Declared: This READ-ONLY bit-field indicates whether or not the Transmit Section of Channel_n is currently declaring the DMO Alarm condition. As configured, the Transmit Section will either internally (via the TTIP_n and TRING_n) or externally (via the MTIP_n and MRING_n) check the Transmit Output DS3/E3/STS-1 Line signal for bipolar pulses. If the Transmit Section were to detect no bipolar for 128 consecutive bit-periods, then it will declare the Transmit DMO Alarm condition. This particular alarm can be used to check for fault conditions on the Transmit Output Line Signal path. The Transmit Section will clear the Transmit Output Line Signal. 0 - Indicates that the Transmit Section of Channel_n is NOT currently declaring the Transmit DMO Alarm condition. 1 - Indicates that the Transmit Section of Channel_n is currently declaring the Transmit DMO Alarm condition.

TABLE 36: TRANSMIT CONTROL REGISTER - CHANNEL n ADDRESS LOCATION = 0XM4

BIT NUMBER	ΝΑΜΕ	Түре	DESCRIPTION
7 - 6	Reserved		
5	Internal Transmit Drive Monitor Enable	R/W	Internal Transmit Drive Monitor Enable - Channel_n: This READ/WRITE bit-field is used to configure the Transmit Section of Channel_n to either internally or externally monitor the TTIP_n and TRING_n output pins for bipolar pulses, in order to determine whether to declare the Transmit DMO Alarm condition. If the user configures the Transmit Section to externally monitor the TTIP_n and TRING_n output pins (for bipolar pulses) then the user must connect the MTIP_n and MRING_n input pins to their corresponding TTIP_n and TRING_n output pins (via a 270 ohm series resistor). If the user configures the Transmit Section to internally monitor the TTIP_n and TRING_n output pins (for bipolar pulses), the user does NOT need to conect the MTIP_n and MRING_n input pins. This monitoring will be per- formed internally at the TTIP_n and TRING_n pads. 0 - Configures the Transmit Drive Monitor to externally monitor the TTIP_n and TRING_n output pins for bipolar pulses. 1 - Configures the Transmit Drive Monitor to internally monitor the TTIP_n and TRING_n output pins for bipolar pulses.
4	Insert PRBS Error	R/W	 Insert PRBS Error - Channel_n: A "0 to 1" transition within this bit-field causes the PRBS Generator (within the Transmit Section of Channel_n) to generate a single bit error within the outbound PRBS pattern-stream. Notes: This bit-field is only active if the PRBS Generator and Receiver have been enabled within the corresponding Channel. After writing the "1" into this register, the user must execute a write operation to clear this particular register bit to "0" in order to facilitate the next "0 to 1" transition in this bit-field.
3	Reserved		

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

TABLE 36: TRANSMIT CONTROL REGISTER - CHANNEL n ADDRESS LOCATION = 0XM4

BIT NUMBER	NAME	Түре	DESCRIPTION
2	TAOS	R/W	 Transmit All OneS Pattern - Channel_n: This READ/WRITE bit-field is used to command the Transmit Section of Channel_n to generate and transmit an unframed, All Ones pattern via the DS3, E3 or STS-1 line signal (to the remote terminal equipment). Whenever the user implements this configuration setting, the Transmit Section will ignore the data that it is accepting from the System-side equipment and output the "All Ones" Pattern. 0 - Configures the Transmit Section to transmit the data that it accepts from the System-side Interface. 1 - Configures the Transmit Section to generate and transmit the Unframed, All Ones pattern.
1	TxCLKINV	R/W	 Transmit Clock Invert Select - Channel_n: This READ/WRITE bit-field is used to select the edge of the TxCLK_n input that the Transmit Section of Channel_n will use to sample the TxPOS_n and TxNEG_n input pins, as described below. 0 - Configures the Transmit Section (within the corresponding channel) to sample the TxPOS_n and TxNEG_n input pins upon the falling edge of TxCLK_n. 1 - Configures the Transmit Section (within the corresponding channel) to sample the TxPOS_n and TxNEG_n input pins upon the falling edge of TxCLK_n. 1 - Configures the Transmit Section (within the corresponding channel) to sample the TxPOS_n and TxNEG_n input pins upon the rising edge of TxCLK_n. Mote: This is done on a per-channel basis.
0	TxLEV	R/W	 Transmit Line Build-Out Select - Channel_n: This READ/WRITE bit-field is used to enable or disable the Transmit Line Build-Out (e.g., pulse-shaping) circuit within the corresponding channel. The user should set this bit-field to either "0" or to "1" based upon the following guidelines. 0 - If the cable length between the Transmit Output (of the corresponding Channel) and the DSX-3/STSX-1 location is 225 feet or less. 1 - If the cable length between the Transmit Output (of the corresponding Channel) and the DSX-3/STSX-1 location is more than 225 feet . The user must follow these guidelines in order to insure that the Transmit Section (of Channel_n) will always generate a DS3 pulse that complies with the Isolated Pulse Template requirements per Bellcore GR-499-CORE, or an STS-1 pulse that complies with the Pulse Template requirements per Telcordia GR-253-CORE. Note: This bit-field is ignored if the channel has been configured to operate in the E3 Mode.

BIT NUMBER	ΝΑΜΕ	Түре	DESCRIPTION
7 - 6	Reserved		
5	Disable DLOS Detector	R/W	 Disable Digital LOS Detector - Channel_n: This READ/WRITE bit-field is used to enable or disable the Digital LOS (Loss of Signal) Detector within Channel_n, as described below. 0 - Enables the Digital LOS Detector within Channel_n. 1 - Disables the Digital LOS Detector within Channel_n. Note: This bit-field is only active if Channel_n has been configured to operate in the DS3 or STS-1 Modes.
4	Disable ALOS Detector	R/W	 Disable Analog LOS Detector - Channel_n: This READ/WRITE bit-field is used to either enable or disable the Analog LOS (Loss of Signal) Detector within Channel_n, as described below. 0 - Enables the Analog LOS Detector within Channel_n. 1 - Disables the Analog LOS Detector within Channel_n. Note: This bit-field is only active if Channel_n has been configured to operate in the DS3 or STS-1 Modes.
3	RxCLKINV	R/W	Receive Clock Invert Select - Channel_n: This READ/WRITE bit-field is used to select the edge of the RxCLK_n out- put that the Receive Section of Channel_n will use to output the recovered data via the RxPOS_n and RxNEG_n output pins, as described below. 0 - Configures the Receive Section (within the corresponding channel) to output the recovered data via the RxPOS_n and RxNEG_n output pins upon the rising edge of RCLK_n. 1 - Configures the Receive Section (within the corresponding channel) to output the recovered data via the RxPOS_n and RxNEG_n output pins upon the rising edge of RCLK_n.

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

TABLE 38: RECEIVE CONTROL REGISTER - CHANNEL n ADDRESS LOCATION = 0XM5

BIT NUMBER	NAME	Түре	DESCRIPTION
2	LOSMUT Enable	R/W	 Muting upon LOS Enable - Channel_n: This READ/WRITE bit-field is used to configure the Receive Section (within Channel_n) to automatically pull their corresponding Recovered Data Output pins (e.g., RxPOS_n and RxNEG_n) to GND for the duration that the Receive Section declares the LOS defect condition. In other words, this feature (if enabled) will cause the Receive Channel to automatically mute the Recovered data anytime the Receive Section declares the LOS defect condition. 0 - Disables the Muting upon LOS feature. In this setting the Receive Section will NOT automatically mute the Recovered Data whenever it is declaring the LOS defect condition. 1 - Enables the Muting upon LOS feature. In this setting the Receive Section will automatically mute the Recovered Data whenever it is declaring the LOS defect condition.
1	Receive Monitor Mode Enable	R/W	 Receive Monitor Mode Enable - Channel_n: This READ/WRITE bit-field is used to configure the Receive Section of Channel_n to operate in the Receive Monitor Mode. If the user configures the Receive Section to operate in the Receive Monitor Mode, then it will be able to receive a nominal DSX-3/STSX-1 signal that has been attenuated by 20dB of flat loss along with 6dB of cable loss, in an error-free manner. However, internal LOS circuitry is suppressed and LOS will never assert nor LOS be declared when operating under this mode. 0 - Configures the corresponding channel to operate in the Receive Monitor Mode.
0	Receive Equalizer Enable	R/W	 Receive Equalizer Enable - Channel_n: This READ/WRITE register bit is used to enable or disable the Receive Equalizer block within the Receive Section of Channel_n, as listed below. 0 - Disables the Receive Equalizer within the corresponding channel. 1 - Enables the Receive Equalizer within the corresponding channel. Note: For virtually all applications, we recommend that the user set this bitfield to "1" (for all channels) and enable the Receive Equalizer.

5	PRBS Enable	R/W	 PRBS Generator and Receiver Enable - Channel_n: This READ/WRITE bit-field is used to enable or disable the PRBS Generator and Receiver within a given Channel of the XRT75R12. If the user enables the PRBS Generator and Receiver, then the following will happen. 1. The PRBS Generator (which resides within the Transmit Section of the Channel) will begin to generate an unframed, 2^15-1 PRBS Pattern (for DS3 and STS-1 applications) and an unframed, 2^23-1 PRBS Pattern (for E3 applications). 2. The PRBS Receiver (which resides within the Receive Section of the Channel) will now be enabled and will begin to search the incoming data for the above-mentioned PRBS patterns. 0 - Disables both the PRBS Generator and PRBS Receiver within the corre- sponding channel. 1 - Enables both the PRBS Generator and PRBS Receiver within the corre- sponding channel. 1 - To check and monitor PRBS Bit Errors, DR (Dual Rail) mode will be over-ridden and Single Rail mode forced for the duration of this mode. This will configure the RNEG/LCV_n output pin to function as a PRBS Error Indicator. All errors will be flagged on this pin. The errors will also be accumulated in the 16 bit Error counter for the channel. 2. If the user enables the PRBS Generator and PRBS Receiver, the Channel will ignore the data that is being accepted from the System-side Equipment (via the TxPOS_n and TxNEG_n input
			 as a PRBS Error Indicator. All errors will be flagged on thi The errors will also be accumulated in the 16 bit Error count the channel. If the user enables the PRBS Generator and PRBS Receive Channel will ignore the data that is being accepted from

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

TABLE 40: CHANNEL CONTROL REGISTER - CHANNEL n ADDRESS LOCATION = 0xm6

BIT NUMBER	ΝΑΜΕ	Түре	DESCRIPTION									
4	RLB_n	R/W		E bit-field alo a given chan	Channel_n: ng with the corresponding LLB_n bit-field is nel into various loop-back modes ass shown							
			LLB_n	RLB_n	Loop-back Mode							
			0	0	Normal (No Loop-back) Mode							
			0 1 Remote Loop-back Mode									
			1 0 Analog Local Loop-back Mode									
			1	1	Digital Local Loop-back Mode							
3	LLB_n	R/W	Loop-Back Sele See the table (ab		ield - Channel_n: _n.							
2	E3_n	R/W	E3 Mode Select - Channel_n: This READ/WRITE bit-field, along with Bit 1 (STS-1/DS3_n) within this reg- ister, is used to configure a given channel into either the DS3, E3 or STS-1 Modes. 0 - Configures Channel_n to operate in either the DS3 or STS-1 Modes, depending upon the state of Bit 1 (STS-1/DS3_n) within this same register. 1- Configures Channel_n to operate in the E3 Mode.									

TWELVE CHANNEL E3/DS3/STS-1 LINE INTERFACE UNIT WITH JITTER ATTENUATOR

TABLE 40: CHANNEL CONTROL REGISTER - CHANNEL n ADDRESS LOCATION = 0XM6

BIT NUMBER	ΝΑΜΕ	Түре	DESCRIPTION
1	STS-1/DS3_n	R/W	 STS-1/DS3 Mode Select - Channel_n: This READ/WRITE bit-field, along with Bit 2 (E3_n) is used to configure a given channel into either the DS3, E3 or STS-1 Modes. This bit-field is ignored if Bit 2 (E3_n) has been set to "1". If Bit 2 (E3_n) is a 0: 0 - Configures Channel_n to operate in the DS3 Mode. 1 - Configures Channel_n to operate in the STS-1 Mode .
0	SR/DR_n	R/W	 Single-Rail/Dual-Rail Select - Channel_n: This READ/WRITE bit-field is used to configure Channel_n to operate in either the Single-Rail or Dual-Rail Mode. If the user configures the Channel to operate in the Single-Rail Mode, the following will happen. The B3ZS/HDB3 Encoder and Decoder blocks (within Channel_n) will be enabled. The Transmit Section of Channel_n will accept all of the outbound data (from the System-side Equipment) via the TxPOS_n input pin. The Receive Section of each channel will output all of the recovered data (to the System-side Equipment) via the TxPOS_n output pin. The corresponding RNEG/LCV_n output pin will now function as the LCV (Line Code Violation or Excessive Zero Event) indicator output pin for Channel_n. If the user configures Channel_n to operate in the Dual-Rail Mode, the following will happen. The RasZS/HDB3 Encoder and Decoder blocks of Channel_n will be disabled. The Receive Section of Channel_n will be configured to accept positive-polarity data via the TxPOS_n input pin and negative-polarity data via the TxPOS_n input pin. The Receive Section of Channel_n will pulse the RxPOS_n output pin "High" (for one period of RCLK_n) for each time a positive-polarity pulse is received via the RTIP_n/RRING_n input pins. Likewise, the Receive Section of each channel will pulse the RxNEG_n output pi High" (for one period of RCLK_n) for each time a negative-polarity pulse is received via the RTIP_n/RRING_n input pins. Configures Channel_n to operate in the Dual-Rail Mode. Configures Channel_n to operate in the Dual-Rail Mode.

Msb							Ls bit
R/W							

Each channel contains a dedicated 16 bit PRBS error counter. When enabled this counter will accumulate PRBS errors (as well as excess zeros and LCVs). The LS byte will "carry" a one over to the MS byte each time it rolls over from 255 to zero until the MS byte also reaches 255. When both counters reach 255, no further errors will be accumulated and "all ones" will signify an overflow condition.

The counter can be read while in the active count mode. Either register may be read "on the fly" and the other byte will be simultaneously transferred into the channel's Error Holding register. The holding register may then be read to supply the Host with a correct 16 bit count (as of the instant of reading). With this mechanism, the Host could rapidly cycle thru reading all twelve counters in order (storing the read byte in scratch RAM) and then come back and read the second byte from each holding register to form the 16 bit accumulation in the Host system.

REVISION HISTORY

REVISION	DATE	Сомментя
1.0.0	05/10/05	Final Release Version of XRT75R12 datasheet.
1.0.1	April 2006	1.Added current and power consumption on Table 50, "DC Electrical Characteristics:," on page 84.
		2. Revised Receive Monitor Enable Bit functional description and Section 3.3.1 description.
		3. Updated Table 3, "The ALOS (Analog LOS) Declaration and Clearance Thresholds for a given setting of REQEN (DS3 and STS-1 Applications)," on page 23.
		4. Minor corrections on Transmitter Section of Features Summary on page 2.
		5. Minor typo corrections in STS1Clk/12M pin description and in Section 1.0 , 3.3 , and 4.5 , Table 7 and Table 9 .
		6. Added Table 2, "Reference Clock Performance Specifications," on page 19.
1.0.2	12/07/06	1.Corrected package thermal resistance specification.
1.0.3	6/11/07	 Corrected global register 0x08 and added global registers 0x80 & 0x88. Added (N = [0:11] & M = 0-5 & 8-D) to channelized register titles.
1.0.4	10/26/07	1.Theta-jC thermal value added.
